P-R-O-C-E-E-D-I-N-G-S

10:15 a.m.

MR. STOLZENBERG: On the record. Good morning. My name is Eric Stolzenberg. I am an investigator with NTSB, Office of Marine Safety. This interview this morning is in regard to the El Faro sinking.

Today is January 28th. It's about 10:15 a.m. We're at the Herbert Engineering Offices in Annapolis. We are here to interview Mr. Eugene van Rynbach and Spencer Schilling regarding the aforementioned accident.

Mr. Schilling, could you spell your name for the record?

MR. SCHILLING: This is Spencer -- The name is Spencer, S-P-E-N-C-E-R, and Schilling is S-C-H-I-L-L-I-N-G.

MR. STOLZENBERG: And, Mr. van Rynbach, could you also spell your name for the record?

MR. van RYNBACH: Yes. Eugene, E-U-G-E-N-E, van Rynbach, V-A-N R-Y-N-B-A-C-H.

MR. STOLZENBERG: Thank you. And I'd also like to go around the rest of the table here at the conference room. We'll go in a clockwise direction.

MR. FRANCE: This is Willa, W-I-L-L-A,

1 France like the country, F-R-A-N-C-E, attorneys for
2 Herbert Engineering, just sitting in today.

3 MR. O'MEARA: Dennis O'Meara, D-E-N-N-I-S
4 O'M-E-A-R-A. I'm representing TOTE Services.

5 MR. GRUBER: Tom Gruber, T-H-O-M-A-S G-R-U-
6 B-E-R, representing ABS.

7 MR. STETTLER: My name is Jeffrey Stettler,
8 J-E-F-F-R-E-Y, Stettler, S-T-E-T-T-L-E-R. I'm a
9 civilian with the U.S. Coast Guard. I'm a member of
10 the Stability Instructions Group for the Naval
11 Architectural Group.

12 MR. STOLZENBERG: And on the phone.

13 MR. KUCHARSKI: Good morning, everyone.
14 This is Michael Kucharski, Group Chairman, NTSB for the
15 El Faro Nautical Operations Group. Spelling, M-I-C-H-
16 A-E-L K-U-C-H-A-R-S-K-I.

17 MR. STOLZENBERG: Okay. Thank you. That's
18 everybody.

19 Just to go over it again, NTSB is an
20 independent Federal agency. We're charged with
21 determining the probable cause of transportation
22 accidents and promoting transportation safety.

23 We're not part of the Department of
24 Transportation. We are not part of the United States
25 Coast Guard. We have no regulatory or enforcement

1 powers. Really, what we do is make recommendations to
2 people like the Coast Guard, DOT and/or companies and
3 others.

4 The purpose of this investigation is to
5 increase safety. It's not to assign fault or blame or
6 liability. However, we cannot guarantee
7 confidentiality or immunity from any legal or licensed
8 actions.

9 As I mentioned earlier, we would like to
10 record the interview. We are in fact doing so. I
11 would just like to ask one more time on the record with
12 Mr. Van Rynbach if you have a problem with the
13 interview being taped.

14 MR. VAN RYNBACH: No.

15 MR. STOLZENBERG: And, Mr. Schilling, do you
16 have an issue with the interview being taped?

17 MR. SCHILLING: No, I don't.

18 MR. STOLZENBERG: Thank you. As I said
19 earlier, you'd be given an opportunity to review the
20 transcript and suggest corrections for accuracy prior
21 to release.

22 Interviewees can have a representative of
23 your choice present. The representative may not
24 testify for the interviewee. And the comments from the
25 representative should be limited and objections are not

1 grounds for NTSB to refrain from asking questions.

2 I just ask. Do you have a person here who
3 you are comfortable with and who is that person?

4 MR. VAN RYNBACH: Our representative would
5 be Willa France.

6 MR. STOLZENBERG: Okay. Thank you. Please
7 if we do ask questions, can you reply to the best of
8 your recollection? If you don't understand a question,
9 please ask to have it repeated. We are certainly here
10 to repeat it. And if you later on realize you
11 misstated or remember something else about a question,
12 feel free to bring it back up and let us know we need a
13 break. Let us know that's all okay to do so. If you
14 don't know an answer to something, feel free to say "I
15 don't know the answer to that."

16 All right. We'll start and we'll kick it
17 off. We'll start with Mr. Schilling. What is your job
18 title and your employer?

19 MR. SCHILLING: I'm President of Herbert
20 Engineering and a Naval architect. And I've been with
21 Herbert Engineering for 30 some years.

22 MR. STOLZENBERG: And can you briefly
23 describe your marine experience up in those 30 years
24 including Herbert Engineering in general, training and
25 background?

1 MR. SCHILLING: It's been -- It's almost --
2 Well, bachelors degree in Naval architecture, marine
3 engineering, a masters degree from UC Berkeley in naval
4 architecture and ocean engineering. I've been with
5 Herbert doing commercial ship design for 33 years.

6 MR. STOLZENBERG: And from day one with
7 Herbert Engineering?

8 MR. SCHILLING: There was one employer
9 before that for about a year, David J.C. Moore Limited.

10 MR. STOLZENBERG: Did you have a specialty
11 over those 30 years?

12 MR. SCHILLING: Mostly stability and
13 structures. In general, ship design.

14 MR. STOLZENBERG: Ship design and any Naval
15 experience, U.S. Naval experience.

16 MR. SCHILLING: No.

17 MR. STOLZENBERG: Mostly commercial.

18 MR. SCHILLING: All commercial.

19 MR. STOLZENBERG: Commercial. Thank you.

20 And, Mr. van Rynbach, if you could.

21 MR. VAN RYNBACH: Sure, this is Eugene. I'm
22 currently Vice President of Herbert Engineering,
23 General Manager of the Annapolis office. I've been
24 here since March of 2005.

25 Previous to that, I was approximately 20

1 years with the Container Ship Liner Company, sea/land
2 service and its offshoot, U.S. Ship Management. Prior
3 to that, I was a consultant working with my father.
4 And I worked for early in my career ABS for two years
5 in plan approval. I also have about two years of
6 seagoing experience with a marine engineer's license.

7 MR. STOLZENBERG: Thank you.

8 MR. VAN RYNBACH: Also just on the
9 education, I have a bachelors of science in mechanical
10 engineering and naval architecture from the University
11 of California and a masters degree in transportation
12 management from SUNY New York.

13 MR. STOLZENBERG: All right. I guess
14 whoever wants to field it just please say your name.
15 I'm just looking for a brief history of Herbert
16 Engineering Corporation. When was it started? What's
17 its primary work?

18 MR. SCHILLING: Okay. The company was
19 founded and started by Bob Herbert in 1963 in San
20 Francisco. It was incorporated in 1973 as a California
21 corporation. It's an employee owned company and has
22 maintained its same basic structure since its
23 origination. We've always been involved in commercial
24 ship design, large commercial ships, container ships,
25 tanker, bulk carriers, open hatch bulk carriers as one

1 of the earliest specialties. Always primarily working
2 for owner and operators in design of new ships and
3 support during maintenance and operations in ongoing
4 vessel life issues.

5 MR. STOLZENBERG: Okay. Within those
6 subsets, what does Herbert currently provide for
7 commercial ships with regard to stability and then with
8 regard to structure? What types of products are
9 currently provided in general?

10 MR. SCHILLING: Well, the services we
11 provide include initial concept design, preliminary
12 design, basic design, new building acquisition support
13 for ships, plan review. It would include all aspects
14 of design, both stability, structures, marine
15 engineering systems, outfit. We tended to focus on for
16 container ships container securing systems and things
17 like that as well.

18 MR. STOLZENBERG: Would you say that's a
19 full service naval architecture firm then? The full
20 gambit of services and products? You could provide a
21 contract design for a large vessel.

22 MR. SCHILLING: Right. We don't produce
23 production drawings. We don't have the staff to
24 produce a full set of production drawings. Usually
25 it's limited to the basic design and the basic class

1 approval drawings we might do. But we wouldn't do the
2 detailed production drawings.

3 Sometimes on conversion projects,
4 modifications for ships and whether it be
5 machinery/mechanical system modifications or
6 modifications for cargo arrangements and stowage, we
7 might do detailed drawings that could be given directly
8 to the shipyard.

9 MR. STOLZENBERG: Okay. But you would
10 provide a packet to the shipyard where the shipyard
11 would then produce all the detailed level drawings.

12 MR. SCHILLING: Right. So we wouldn't
13 participate in that detailed production drawing.

14 MR. STOLZENBERG: Okay. Thank you. What
15 products do you currently provided in regard to
16 stability? I know there's a CargoMax program. But do
17 you also provide T&S booklets? And I don't just mean
18 to El Faro or TOTE. In general, do you provide this to
19 operators?

20 MR. SCHILLING: Yes. We produce trim and
21 stability booklets. We'll do intact damage stability
22 studies. We'll do inclinings and that kind of thing.

23 We have a software company. That software
24 company is the one that actually produces and develops
25 and releases the software. The two main products there

1 are the CargoMax loading instrument. There's the
2 shipboard trim and stability or stability and strength
3 calculation tool that the master mates would use to
4 verify stability in line with the trim and stability
5 booklet. And we also, the company also, produces the
6 HECSALV salvage response software for rapid response
7 and it's also a design tool for doing it. So we used
8 to do our ship design, our intact stability
9 assessments, our damage stability assessments.

10 MR. VAN RYNBACH: This is Eugene. Spencer,
11 you may want to mention that that's not a fully owned
12 company by Herbert. It's a joint venture of 50/50 with
13 the American Bureau of Shipping. And the name of the
14 stability software company is called Herbert-ABS
15 Software Solutions.

16 MR. STOLZENBERG: Okay. Thank you. I think
17 we'll come back to the Herbert-ABS Solutions later as
18 far as the makeup of it. So to be clear, if someone
19 designs a T&S booklet or works on a T&S booklet and
20 produces a T&S booklet from Herbert Engineering
21 Corporation, is that separate and wouldn't interact
22 with the software solutions group that produces a
23 CargoMax?

24 MR. SCHILLING: Right. The trim and
25 stability booklet whether it's completed for a new

1 building or revision to it for changes to ship, it
2 would be done by Herbert Engineering by the engineering
3 side. The software company when it produces the
4 loading instrument would take whatever approved trim
5 and stability booklet that's been prepared whether it's
6 by Herbert Engineering or someone else to produce the
7 loading instrument.

8 MR. STOLZENBERG: The loading instrument in
9 the trim and stability booklet, does that use GHS?
10 Does it use a CargoMax? Does it use a HECSALV or?
11 Excuse my ignorance. I've never worked in any
12 stability department for a large Naval arch firm. Is
13 it -- What program is used to produce this T&S booklet?

14 MR. SCHILLING: If we're going to do the
15 trim and stability booklet we would be using HECSALV to
16 do the calculations.

17 MR. STOLZENBERG: On the Herbert side.

18 MR. SCHILLING: Right.

19 MR. VAN RYNBACH: You may want to spell
20 HECSALV. That's H-E-C-S-A-L-V. This is Eugene.

21 MR. STOLZENBERG: HECSALV okay. Thank you.
22 All right. I think we'll stay along these lines of
23 thinking. If we look at a loading instrument versus a
24 T&S booklet, are both of those required products for a
25 large vessel, say a container ship like the El Faro?

1 Or is it dependent upon your customer and what they
2 request?

3 MR. SCHILLING: The trim and stability
4 booklet is definitely required. And the loading
5 instrument is required now. In terms of the El Faro,
6 if it was required, it depends on when the ship was
7 built. It didn't used to be required for old ships
8 back in the '60s and '70s because they didn't have them
9 then.

10 And so the requirement for the El Faro I
11 would have to look up. I don't recall if it was
12 required to have one when it was installed.

13 MR. STOLZENBERG: Okay. And to help me,
14 what is a loading instrument if you were going to
15 describe it? What's the purpose of it? What does it
16 do?

17 MR. SCHILLING: A loading instrument is just
18 a computer program that should be basically
19 implementing the loading guidance and stability
20 information in the trim and stability booklet.

21 MR. STOLZENBERG: And that would be in the
22 case of the El Faro the roll-on/roll-off cargo, the
23 load-on/load-off container ships, fuel.

24 MR. SCHILLING: All the consumables and
25 liquids, right.

1 MR. STOLZENBERG: All the consumables.

2 MR. SCHILLING: It shouldn't replicate the
3 results of the trim and stability booklet. So any of
4 the guidance in the trim and stability booklet for
5 loading information should be replicated in the loading
6 instrument.

7 MR. STOLZENBERG: Okay. I wanted to ask
8 some questions about load lines, but I think since
9 we've kicked off down this direction I'd like to go
10 around the table and stick with this line. Sometimes
11 in order to make this interview more smooth and
12 cohesive it's better to bring everybody in and talk
13 about a subject and then move onto another subject.

14 I think in this case it will be somewhat
15 difficult because there's such a vast amount of
16 specific information. But we'll do our best as we try
17 to begin to understand some things. So I'll go around
18 the table and ask if everyone else has questions on
19 this. I'll start with Dennis.

20 MR. O'MEARA: Can you clarify? You said
21 loading instrument covers what's in the T&S booklet
22 from a stability booklet. So a loading instrument
23 always covers stability and strength issues.

24 MR. SCHILLING: The loading instrument?

25 MR. O'MEARA: Yes.

1 MR. SCHILLING: Well, I'm hesitating only
2 because as a older ship there weren't always strength
3 requirements. So when we look at an old loading, it
4 doesn't always have strength limits in it. It might
5 just have stability.

6 And also sometimes when programs are
7 produced, they covered strength. But stability wasn't
8 required or wasn't approved. So it doesn't always have
9 strength and stability. I think in this case both the
10 stability and the -- Well, actually in the T&S booklet,
11 it doesn't include strength values either. There's a
12 separate document or separate guidance that would be
13 given on longitudinal strength.

14 MR. FRANCE: This is Willa speaking. When
15 you say this case, Spencer, you're talking about the El
16 Faro.

17 MR. SCHILLING: For the El Faro.

18 MR. FRANCE: All right.

19 MR. SCHILLING: Correct.

20 MR. VAN RYNBACH: Yes, this is Eugene.
21 Normally, the stability booklet, it was traditionally
22 stability and then there was a separate document called
23 the loading manual which had the strength information.
24 But now they've tended to become integrated in the last
25 20 years. But at the time the El Faro was built in the

1 early ages, they were separate documents.

2 MR. STOLZENBERG: This is Eric Stolzenberg.

3 So what you're saying, Eugene, what's allowed that
4 confluence to occur, is that the powerful software
5 that's since come into being that the loading
6 instrument can incorporate structure and stability and
7 loading?

8 MR. VAN RYNBACH: Yes. This is Eugene.

9 MR. SCHILLING: Yes, I think it was a
10 requirement also -- this is Spencer -- about what was
11 important for the specific ship design. Tankers and
12 bulkers I think usually the loading instrument was to
13 help for strength issues, checking, bending sheer force
14 because that was the critical loading element. You
15 know, it was critical for loading.

16 The stability was not really an issue for
17 older tankers and bulk carriers. So the loading
18 instruments didn't check stability. It was mostly for
19 strength. Or if they did check stability for the T&S
20 booklet, it wasn't necessarily even required to be
21 approved for stability.

22 But these days it's more common as Gene said
23 to have a document, a loading manual, that covers both
24 in terms of stability and strength. And the loading
25 instrument does both as well. And now these are both

1 approved when they're included in.

2 MR. VAN RYNBACH: This is Eugene again.
3 They used to be separate hand calculations. So there
4 were separate booklets. There are two different
5 methods of calculating. Strength was calculated with a
6 different method than stability.

7 With the advent of the computer, you had
8 this one program, these loading programs like CargoMax
9 that did it altogether. So then they brought the
10 documentation together to match what the computer was
11 doing.

12 MR. STOLZENBERG: Okay. This is Eric
13 Stolzenberg. That's helpful to get back.

14 MR. VAN RYNBACH: Yeah.

15 MR. STOLZENBERG: Especially when you're
16 talking about a ship that's been in service as long as
17 the El Faro to see how things catch up. I appreciate
18 that.

19 MR. STETTLER: Could I follow up on that?

20 MR. STOLZENBERG: Yes.

21 MR. STETTLER: Jeff Stettler. I just wanted
22 to, Eugene, follow up. Are you aware of any
23 requirements in that regard in terms of combining the
24 two if there isn't a loading manual separate for
25 example? You mentioned a trim and stability book and a

1 loading manual originally meant to address two
2 different aspects of the vessel loading. Is there any
3 requirement that both of those exist just to your
4 knowledge?

5 MR. VAN RYNBACH: This is Eugene. Modern
6 ships are required to have both. And they can be in
7 the same manual. Normally, they are. But ABS rules
8 require a ship to have a loading manual. It's in the
9 longitudinal strength section.

10 The stability is separate. Stability
11 actually was not traditionally in the ABS rules. It
12 was SOLAS (phonetic) or different or the Coast Guard
13 required it. ABS always required some sort of a
14 strength calculation, at least, in modern years.

15 MR. STETTLER: Thank you.

16 MR. GRUBER: When you've produced a
17 stability instrument or -- I'm sorry -- a loading
18 instrument, how often is that updated?

19 MR. SCHILLING: You're talking specifically
20 about the loading instrument.

21 MR. GRUBER: Yes.

22 MR. SCHILLING: Or the program. Typically,
23 the loading instrument isn't updated unless the ship
24 configuration changes. Something that would initiate a
25 change in the trim and stability booklet or the loading

1 manual would also initiate a change in the loading
2 instrument. But otherwise it wouldn't be updated
3 because again nothing has changed in the official
4 stability guidance to the vessel in terms of the trim
5 and stability booklet. So there would be no need to
6 update the program.

7 MR. GRUBER: Are there any other reasons
8 that the program itself would be updated?

9 MR. SCHILLING: New revisions. I mean if
10 there were software and hardware changes that made the
11 particular program obsolete. Then it had to be
12 upgraded to a new revision to run on new hardware and
13 with a new operating system for instance. There might
14 be updates to the program. It wouldn't necessarily
15 change the content and calculations at that point. But
16 it could be that it's a revision issue.

17 There might also be an owner could select to
18 add features that were above and beyond what was
19 required for basic stability and strength calculations
20 to make it easier to find the loading conditions or to
21 do other things that would help them in their loading
22 analysis.

23 MR. GRUBER: Okay. Thank you.

24 MR. O'MEARA: This is Dennis. Could I just
25 -- How are software products like CargoMax and HECSALV

1 validated or certified so that you know that the
2 results that they're calculating are indeed true? How
3 does that -- What is the process for configuration
4 management on that so that you know that the software
5 is actually producing correct results?

6 MR. SCHILLING: I'm getting a little bit
7 over into what the software company does.

8 MR. O'MEARA: Yes.

9 MR. SCHILLING: For CargoMax. I can kind of
10 reflect in general on those things because I used to be
11 involved with CargoMax production years ago. But for
12 each individual ship the loading instrument is
13 submitted to Class for review and approval. And
14 usually with that goes sample conditions that are run.

15 And I think it used to be checked against a
16 second party tool, whether that was Class's tool or
17 that was some additional secondary calculations. It
18 could be just checked against in terms of stability
19 booklet results. So if you ran the same sample if you
20 look in the trim and stability booklet and get the same
21 results, then it's confirmation that the program is
22 giving the correct thing. And that's what Class or
23 Flag would look at in addition to whatever they do
24 internally with their own calcs to verify that the
25 program is working correctly.

1 There's also type approval process from some
2 classes that look at the code and look at the logic and
3 look at the program in general and how the architecture
4 is set up to verify that it can be approved on a case
5 by case basis later.

6 MR. VAN RYNBACH: This is Eugene as well. I
7 think if it's an approved loading instrument there's
8 class approved test conditions. And then the ABS
9 surveyor -- I think it's every year -- is supposed to
10 go on board and have the ship run the computer and get
11 the same results as the test conditions. So it's
12 checked periodically by class I think every year to
13 confirm that the computer is still working or the
14 loading instrument is still working correctly.

15 MR. GRUBER: This is Tom Gruber. To follow
16 up on Dennis' question, is there any confirmation to
17 the actual ship's loading done to validate the program?

18 MR. VAN RYNBACH: I'm not sure. Could you
19 repeat the question again?

20 MR. GRUBER: If you have a loading condition
21 that's developed using the CargoMax, is it ever
22 validated against the actual loading of the ship?

23 PARTICIPANT: Observed.

24 MR. GRUBER: The observed conditions to
25 verify that the draft and the trim and the heel on the

1 ship are actually what's represented in the program
2 output.

3 MR. SCHILLING: I'm not aware of validations
4 that are done by class on that aspect. Normally, the
5 calculations duplicate what's in the trim and stability
6 booklet to the extent that the trim and stability
7 booklet accurately represents what calculated drafts
8 are compared to observed drafts. Then the loading
9 instrument should give the same results.

10 If there are differences between calculated
11 drafts and observed drafts that the operator is seeing
12 in service, then we might be notified that there's some
13 discrepancy or some issue and be asked to investigate
14 what that might be. But I don't know if there's any
15 check of the calculated versus an observed draft based
16 on a loading condition that's done as part of the
17 approval process.

18 MR. STOLZENBERG: May I just inject?
19 Spencer, if you could slow down your answers a bit.

20 MR. SCHILLING: Okay.

21 MR. STOLZENBERG: Your head is cram packed
22 with information. But whoever is going to be
23 transcribing this is going to have some difficulty.

24 MR. SCHILLING: Okay.

25 MR. VAN RYNBACH: This is Eugene again. I

1 think normally the master checks the drafts before they
2 depart. And they would possibly -- At least good
3 practice would be to compare it to the calculated
4 drafts. So that's sort of a check that's done with
5 every departure.

6 MR. GRUBER: Tom Gruber again. So Herbert
7 doesn't do an actual check against the condition. You
8 would only do that if you were notified that there were
9 discrepancies.

10 MR. SCHILLING: Right.

11 MR. GRUBER: Thank you.

12 MR. STOLZENBERG: This is Eric Stolzenberg.
13 I would like to follow up on that just to be specific.
14 Was there ever a notification for the El Faro to come
15 and check that draft, observed draft versus calculated?

16 MR. SCHILLING: This is Spencer. I don't
17 have a recollection of any. It doesn't mean it didn't
18 have it. I just don't have a recollection of any. And
19 I don't know if. Usually that query would go to
20 software group to answer because they would be looking
21 at the loading instrument and wondering why they
22 observed the calculated drafts didn't match up.

23 So they would get that query first. It
24 wouldn't necessarily come to Herbert Engineering. And
25 I just don't know if they ever got a query on that.

1 MR. STOLZENBERG: So it would likely go to
2 the software group first -- this is Eric Stolzenberg --
3 even though the T&S booklet comes from Herbert
4 Engineering.

5 MR. SCHILLING: Right. Because the crew's
6 not -- The crew's using the loading instrument, the
7 program, to do the calculations. That's what they're
8 actually comparing. Even though it's matching the T&S
9 booklet, it's not referring and using the T&S booklet
10 on a day to day basis. So if they're calculating
11 drafts with their loading instrument and they're
12 comparing those with observed drafts and there's an
13 issue with it, they'll look at the loading instrument
14 and look at the supplier and make the call to that
15 support line.

16 MR. STOLZENBERG: Eric again. And my
17 follow-up with that is who's the individual at Herbert-
18 ABS Software Solutions who would be the contact person
19 for this type of inquiry?

20 MR. SCHILLING: The gentleman I think that's
21 knowledgeable about this particular program and ship is
22 Mike Newton.

23 MR. STOLZENBERG: Okay.

24 MR. SCHILLING: The last name is spelled N-
25 E-W-T-O-N. Whether he was the one who would have taken

1 any call from TOTE on this, I'm not sure. But he would
2 I think be aware of any content.

3 MR. STOLZENBERG: Eric again. But he might
4 be more familiar with the software side of the CargoMax
5 and the HECSALV for the El Faro, more so than Herbert
6 Engineering Corporation.

7 MR. SCHILLING: That's true.

8 MR. STOLZENBERG: Am I correct in saying
9 that?

10 MR. SCHILLING: Yes, you are.

11 MR. STOLZENBERG: Okay. Thank you.

12 MR. STETTLER: Could I follow up with that?
13 Jeff Stettler from the Coast Guard. So I just want to
14 make sure I understand. The CargoMax as it develops
15 the loading instrument has a model of the ship. I want
16 to get into a little more detail perhaps later on that.
17 But it is tested or it is validated against the trim
18 and stability book, correct?

19 MR. SCHILLING: Correct.

20 MR. STETTLER: Okay. So if there's a
21 question about CargoMax by the shipowner or the
22 operator, I would think that would also then be where
23 the observed condition doesn't match the CargoMax
24 produced position. I would think then that would also
25 be an observation that the observed condition is not

1 matching the trim and stability book.

2 MR. SCHILLING: Correct.

3 MR. STETTLER: So I would think that if
4 there was a question about that that would also get
5 back to (Inaudible) as well.

6 MR. SCHILLING: Yes. This is Spencer.
7 Quite true in normal situations. So what might happen
8 a call from the operator would be made to the CargoMax
9 group and it would have an inquiry about observed
10 drafts and a mention of calculated drafts. Can you
11 help us figure out what's going on? We might evaluate,
12 the software group might evaluate, load case to see if
13 there were any obvious errors in entry of loading
14 definition.

15 If they couldn't find anything out, they
16 could come to Herbert Engineering, especially if we had
17 done the trim and stability booklet and the loading
18 manual and ask us if we had any insight to that and
19 could offer things.

20 Even if we didn't do the T&S booklet, they
21 might come to us to help us evaluate what's going on
22 because it might require that an additional
23 investigation be done. There could be an in service
24 (Inaudible) survey that could be done or something like
25 this if there were errors that needed to be tracked

1 down.

2 MR. STETTLER: Jeff Stettler again. So to
3 your knowledge that was not done in the case of the El
4 Faro.

5 MR. SCHILLING: I don't have any
6 recollection of that.

7 MR. STETTLER: Okay. But that is a question
8 we'd perhaps ask of Herbert Software Solutions to
9 confirm that.

10 MR. SCHILLING: (Indicating)

11 MR. STOLZENBERG: You have to speak.

12 MR. SCHILLING: Yes, this is Spencer. Yes.
13 I don't recollect if Herbert Engineering was ever
14 involved in that sort of evaluation for the El Faro.
15 And I don't know if Herbert-ABS Software Company was
16 contacted regarding that.

17 MR. STOLZENBERG: Okay. Thank you.

18 MR. GRUBER: About the program itself, I
19 have no further questions.

20 MR. STOLZENBERG: Do you have other
21 questions, Jeff?

22 MR. STETTLER: I will have a bunch of
23 questions that relate to CargoMax, but I think they're
24 more detailed and its relationship to some of the other
25 drawings and other things. Should we hold off on those

1 detailed questions?

2 MR. STOLZENBERG: I mean we will for a
3 moment.

4 MR. GRUBER: I do have one question. You
5 said that the software programs are developed by
6 Herbert-ABS Company. How far back does that go? Can
7 you tell us when that was created and what was there
8 before that?

9 MR. SCHILLING: Right. Maybe I'll start at
10 the beginning. The software was initially developed by
11 Herbert Engineering as an internal software developed
12 group. This is Spencer. That software group was in
13 Herbert Engineering and was eventually split off into a
14 separate company. And I don't recollect the actual
15 dates, but it was probably I think in the early 2000's
16 that it was split off into a separate company, wholly
17 owned by Herbert Engineering. And they were responsible
18 -- they took over all the code developing, marketing
19 support, delivery to CargoMax, HECSALV and related
20 software.

21 MR. GRUBER: The name of that company.

22 MR. SCHILLING: Oh, it was Herbert Software
23 Solutions Inc., HSSI, I think. And then there was for
24 a while we had a joint company called LMI, Load Master
25 International, where we partnered with Kockumation in

1 Sweden. Kockumation is K-O-C-K-U-M-A-T-I-O-N.

2 And through that CargoMax and HECSALV
3 continued to be produced. The code didn't change. We
4 didn't migrate to the Kockumation platform. And then
5 after three years, that partnership was just dissolved
6 and it came back to Herbert Engineering ownership
7 entirely as HSSI, Herbert Software Solutions, Inc.

8 And then I think four or five years ago that
9 company took an investor partner in ABS as a 50 percent
10 shareholder/owner. And that's when the name changed to
11 Herbert-ABS.

12 MR. GRUBER: This is Tom Gruber. So that
13 was around 2010-2011 time frame.

14 MR. SCHILLING: Around then, yes.

15 MR. STETTLER: Jeff Stettler. Just to
16 clarify, is that considered a joint venture?

17 MR. SCHILLING: It's an LLC.

18 MR. STETTLER: LLC, okay.

19 MR. SCHILLING: Yes. And there are two
20 partner owners. Both are 50 percent owners.

21 MR. STETTLER: Thank you.

22 MR. STOLZENBERG: This is Eric Stolzenberg.
23 I think this is one of the topic areas I had was the
24 Herbert-ABS Software Solutions relationship between
25 Herbert Engineering Corporation and ABS. I think we'll

1 go around again including Mike on the phone if there
2 are any questions on the relationship. I think you've
3 covered the history of it right there. We'll hit that
4 topic right now. I'll start with Jeff.

5 MR. STETTLER: Actually, I just thought
6 about this. Which side of ABS? This is on the --
7 forgive me if I don't know the correct terminology.
8 But ABS has a class side as well as a consulting, ABS
9 Consulting. Is this with the ABS Consulting side or is
10 this a different part of ABS, your LLC?

11 MR. SCHILLING: To be honest, I wasn't on
12 the board when it was first -- this is Spencer --
13 formed. I would assume it's with ABS Group as the
14 ownership side. I should clarify that the company is
15 still operated by the same staff that was there before.
16 It's not -- ABS is an investor partner in the company
17 primarily.

18 MR. VAN RYNBACH: This is Eugene. Just to
19 clarify, ABS Group is the consulting or the for profit
20 part of ABS.

21 MR. STETTLER: That's what I was referring
22 to, yes.

23 MR. VAN RYNBACH: ABS Classification is a
24 nonprofit.

25 MR. STETTLER: Right. That's actually what

1 I meant. I just didn't know how to say it.

2 MR. SCHILLING: So ABS is not involved in
3 the production for individual ships of the loading
4 instrument. ABS staff or anything like that.

5 MR. STETTLER: Okay. Jeff Stettler again.
6 Just to clarify or summarize perhaps, so the partner is
7 the ABS Group which is the for profit side of ABS. Is
8 that correct?

9 MR. SCHILLING: This is Spencer. That is my
10 understanding.

11 MR. STETTLER: Okay.

12 MR. SCHILLING: I can confirm that, but
13 that's my understanding.

14 MR. STETTLER: Thank you.

15 MR. STOLZENBERG: This is Eric Stolzenberg.
16 To follow up on that, there to your knowledge are not
17 ABS employees working at the office. It's the core
18 team. ABS is an investor in the joint venture.

19 MR. SCHILLING: Right. Correct. This is
20 Spencer. And the approval process for the loading
21 instrument is carried out the way it's always been
22 done. Submittal is through the class societies. And
23 for ABS there are class approval stability group or
24 their strength group. The same way the software
25 company would be submitting to Lloyd's or GLMV

1 (phonetic), those kind of things.

2 MR. STETTLER: Jeff Stettler again.

3 Spencer, I'm trying to remember back when that joint
4 venture or the company was formed. Was there ever any
5 intent or an effort to combine software in any way,
6 some of the ABS related software suite with the Herbert
7 Engineering software suites, HECSALV or CargoMax? Was
8 there any effort made to bring those two suites
9 together in any way?

10 MR. SCHILLING: This is Spencer. I think
11 the intent was always to keep HECSALV and CargoMax
12 produced the way they are, you know, by the software
13 group and by the joint venture employees. There was
14 never an intent to join it with Nautical Systems and
15 all their software.

16 There was certainly interest and discussions
17 about perhaps linking the software products together.
18 It just made sense for -- Well, I'm speculating what
19 ABS was interested in. But just they might have
20 software that they would find helpful to link with any
21 loading instrument and CargoMax being one of them might
22 be useful to link with. But in terms of the code
23 development and the production and all of the issues
24 there was never an interest or a movement to bring them
25 together.

1 MR. STETTLER: Okay. It was Nautical
2 Systems that was the term I was recalling. But thank
3 you.

4 MR. STOLZENBERG: Mike, any questions on the
5 phone regarding this topic?

6 MR. KUCHARSKI: Yes. I wanted to go back
7 about a half hour ago. Mr. Schilling, you stated you
8 weren't sure if the loading instrument was required
9 with the El Faro. Is that correct?

10 MR. SCHILLING: This is Spencer. I just
11 don't recollect thinking back when it was initially put
12 on if it was put on as a requirement class or it was
13 developed at the request of then I guess SeaStar as an
14 additional tool for the crew to be able to use to help
15 them with loading. I just don't have a recollection of
16 what the initiating issue was.

17 MR. KUCHARSKI: Okay. And is your basic
18 understanding though if it goes through the approval
19 process and it's on board then it has to comply with
20 all the requirements at that time?

21 MR. SCHILLING: Yes. This is Spencer.
22 Certainly now if it's on board the requirements for a
23 loading instrument are that it has to be approved both
24 for strength and stability. In the past, it wasn't
25 necessarily the case that stability calculations had to

1 be approved that were in the loading instrument.

2 MR. KUCHARSKI: Okay. Great. And I think
3 you also mentioned that -- Somebody asked the question
4 about changes required update to the trim and stability
5 booklet or manual. And you talked about that for a
6 little bit. Do you know what triggers that for the
7 revisions or updates to the trim and stability manual?

8 MR. STOLZENBERG: Generally now. Mike, are
9 you talking generally or specifically for the El Faro?

10 MR. KUCHARSKI: For the El Faro.

11 MR. SCHILLING: I'm sorry. Again, this is
12 Spencer. The question was what triggering events
13 happened with regard to the El Faro that would require
14 an update to the T&S booklet and the loading
15 instrument.

16 MR. KUCHARSKI: Yeah, and are there any
17 triggering events that required the addition of the
18 fructose tanks or anything like that? Would that
19 require an update to the trim and stability book?

20 MR. SCHILLING: This is Spencer. It would
21 depend on the nature of the change. The things you
22 look for are updates to light ship weight or to cargo
23 stowage issues and things like that. And things like
24 the fructose tanks, I would have to recollect what was
25 done there. There should be --

1 MR. VAN RYNBACH: This is Eugene. I know a
2 little more about that project. Those were portable
3 tanks. So what was done is some foundations for
4 mounting portable tanks and some piping connections
5 were installed. They were not fixed tanks. They were
6 ISO type container tanks. So I guess they could be
7 treated as cargo.

8 MR. SCHILLING: Right. So if the weights
9 can be entered in the existing cargo loading forms or
10 weight forms either in the T&S book or the loading
11 instrument, that wouldn't necessarily require a change
12 to those and update.

13 PARTICIPANT: Would not.

14 MR. SCHILLING: Would not.

15 MR. STETTLER: This is Jeff Stettler. Are
16 there any regulatory or other requirements that would
17 define that definition that would allow that separation
18 in terms of fixed foundations being considered cargo as
19 opposed to part of the (Inaudible)? Eugene, you just
20 made a definition I think.

21 MR. VAN RYNBACH: Yes.

22 MR. STETTLER: So are you aware of any
23 requirement or definition in the regulations?

24 MR. VAN RYNBACH: This is Eugene. I think
25 what's key is that the weight is included in the ship's

1 stability calculation. So if the master has a method
2 of calculating that weight, that is important.

3 But the light ship weight normally is the
4 fixed weight of the ship and its equipment. It's not
5 related to things which are removal or portable or
6 cargo related directly.

7 And then there is also some thresholds where
8 you have to modify the stability booklet and something,
9 weights of -- what is it -- one or two percent change
10 in light ship weight and also change in the center of
11 gravity. There's some standardized percentages where
12 if you change the light ship by so much you have to
13 redo the stability booklet.

14 MR. STETTLER: Could I just follow up with
15 that? Jeff Stettler again. Eugene, the reason I bring
16 this up is people have asked the question about these
17 fructose tanks in particular.

18 MR. VAN RYNBACH: Yes.

19 MR. STETTLER: So I think I understand. So
20 you were considering the tanks themselves as a cargo
21 weight and indeed I believe TOTE in CargoMax included
22 those in the variable load basically as a trailer.

23 MR. VAN RYNBACH: Yes.

24 MR. STETTLER: The fixed or semi-fixed
25 portion of those systems though which included the

1 foundations and piping and pumping systems, etc., how
2 was it intended by Herbert that those would be viewed,
3 that portion of the system reviewed? Also as cargo?

4 MR. VAN RYNBACH: Those weights were too
5 small to be measurable essentially.

6 MR. STETTLER: Okay.

7 MR. VAN RYNBACH: And I don't know. We're
8 talking 10 tons, five tons, something of that order.
9 So it's not an amount of weight that would trigger a
10 requirement to revise the stability booklet. At some
11 point, you have a 20,000 ton ship.

12 MR. STETTLER: Right.

13 MR. VAN RYNBACH: So five tons or 10 tons,
14 it's a percentage which is so small that it's
15 immeasurable.

16 MR. STETTLER: Yes, right. Thank you. Jeff
17 Stettler again. I was just thinking more in terms of
18 the loading instrument and how that weight was included
19 in the loading instrument. Was there to your knowledge
20 any guidance given to TOTE in terms of how they should
21 include that weight, all of it, including the weight of
22 the fructose cargo, the liquid cargo, in the tanks and
23 their foundations? Was there any guidance given in
24 terms of how they should account for that weight or not
25 to your recollection?

1 MR. VAN RYNBACH: I don't -- this is Eugene
2 -- recall that they raised that question.

3 MR. STETTLER: Okay. Thank you.

4 MR. GRUBER: Tom Gruber. Just to follow up
5 on what you talked about the tanks being nonpermanent,
6 the foundations were welded to the deck.

7 MR. VAN RYNBACH: Yeah, like little
8 foundations -- I don't know -- six inches high,
9 something. As I mentioned, these were ISO containment.
10 So it has supports at four corners like a twist lock
11 type support. So these were little stools six inches
12 high or so for the container to rest on to distribute
13 the load into the deck. And the containers were
14 mounted on those.

15 MR. GRUBER: This is Tom Gruber again. How
16 were they connected to the foundation? Was it a twist
17 lock? Were they welded? Were they bolted?

18 MR. VAN RYNBACH: I think they were welded
19 with a fill-it weld. The container was welded. I
20 would have to check the drawing.

21 MR. GRUBER: Okay. So then there was no way
22 to remove that. When they went into port, there was no
23 way to take that container off and put it back on. So
24 it wasn't semi-permanent. It was welded to the ship.

25 MR. VAN RYNBACH: It was welded to the ship,

1 but it could easily be removed. This was just
2 temporarily put there. I think they were going to -- I
3 don't know. They were going to maybe redeploy the ship
4 and then they would maybe take them out.

5 So it was there because the sister ship had
6 permanent, built-in tanks, the El Morro. And they were
7 scraping that ship. So they needed a temporary method
8 to carry fructose for a one or two year period.

9 I guess TOTE would know this better. I
10 can't say for sure. This is just my recollection that
11 they needed a temporary way to carry the fructose,
12 something that could be easily removed in the future.

13 MR. STETTLER: Jeff Stettler. Can I just
14 follow up that, Eugene? I think that may be one of the
15 things that people are visualizing which is the
16 fructose tanks on the El Yunque, the sister vessel.

17 MR. VAN RYNBACH: Yes.

18 MR. STETTLER: So I'm assuming based on what
19 you're saying you handled the El Yunque system a little
20 differently being that they were larger tanks, twice
21 the capacity I believe, larger foundations, larger
22 piping system. Was that system handled differently?

23 MR. VAN RYNBACH: This is Eugene. We were
24 not involved in the fructose tanks for the other ships.

25 MR. STETTLER: Thank you.

1 MR. VAN RYNBACH: So essentially as I
2 mentioned they were ISO containers. So they were like
3 a cargo container. I think they were -- I don't
4 remember the size, but they had a framework of the
5 container.

6 MR. SCHILLING: The location -- this is
7 Spencer -- displaced other roller trailers.

8 MR. VAN RYNBACH: Yes.

9 MR. STETTLER: Jeff Stettler again. So I
10 think that's why some of this questioning. It's the
11 connection between the similar systems on sister
12 vessels versus the system on the El Faro.

13 MR. VAN RYNBACH: Yes. This is Eugene
14 again. Those other ships had much more permanent
15 installations. They were big cylindrical tanks. It
16 was a different situation.

17 MR. STETTLER: Okay. Thank you.

18 MR. STOLZENBERG: Mike on the phone, do you
19 want to follow up on this line or your earlier thoughts
20 on the previous discussions?

21 MR. KUCHARSKI: No, I'm good. Thank you.

22 MR. STOLZENBERG: Okay. Since we broached
23 the topic, one of the questions I have is what
24 modifications to a vessel require a new dead weight
25 survey or intact and damage stability assessments?

1 Does HEC determine that? Does the Coast Guard? Does
2 ABS determine major modification? What definition
3 applies?

4 If somebody could just give me a feel for
5 what mods to a vessel to your knowledge would require
6 new dead weight and stability assessments.

7 MR. SCHILLING: There's guidance from the
8 Coast Guard that we would follow on what would be a
9 minor and major conversion. And it usually involves
10 changes to the primary ship dimensions, significant
11 changes to cargo carrying capacity or significant
12 weight changes, those types of things.

13 MR. VAN RYNBACH: This is Eugene. Or change
14 of purpose of the ship.

15 MR. SCHILLING: Right. And that would be
16 through when you're making the modification to the
17 ship. That would be a consideration. And if there's a
18 question about whether what you're doing is considered
19 a major or minor conversion, you would field it to the
20 Coast Guard or through Class to determine if that
21 modification was so determined. And then other
22 engineering and other changes might happen to be
23 implemented as to whether it was a major conversion or
24 not, what regulations might be implemented.

25 MR. STOLZENBERG: So if the modification was

1 being done to a vessel and a ship owner asked for that
2 modification, would typically Herbert reach out to
3 Class or Coast Guard early on to determine if it's
4 going to be a major modification? Or is that something
5 that would be at the latter end of a package? Just in
6 general I'm asking and not just the El Faro.

7 MR. SCHILLING: It would usually be earlier
8 on in the process -- this is Spencer -- in
9 consideration of the project going forward because it
10 could have larger implications on whether they want to
11 do the project. It could impact the amount of
12 engineering and the amount of conversion work that
13 needs to be done and the cost.

14 It wouldn't necessarily and it's rarely
15 Herbert Engineering that would contact the Coast Guard.
16 Usually it's the owner that would make the official
17 request or appeal to a determination.

18 MR. STOLZENBERG: And the owner -- this is
19 Eric again -- would state what they generally intended
20 to do.

21 MR. SCHILLING: Right.

22 MR. STOLZENBERG: And when you say the Coast
23 Guard, is that the local OCMi typically? Is it the
24 Marine Safety Center? Which branch of the Coast Guard
25 does that type of appeal or request go to?

1 PARTICIPANT: If you know.

2 MR. SCHILLING: I don't because we don't
3 normally write the letter.

4 MR. STOLZENBERG: Okay. Thank you. All
5 right. And you also mentioned ABS. In the past, would
6 Herbert reach out to ABS and ask for some guidance or
7 what they believe might occur?

8 MR. SCHILLING: Not for an official ruling
9 on it probably. I think it would go directly to the
10 Coast Guard. We might ask their opinion of what they
11 thought it might be.

12 MR. STOLZENBERG: And then at some point I
13 imagine you could become aware of what that decision
14 was.

15 MR. SCHILLING: Right.

16 MR. STOLZENBERG: And that would come back
17 through the owner.

18 MR. SCHILLING: Right.

19 MR. STOLZENBERG: Okay. Thank you. One
20 other question I had is often I hear two percent is a
21 minimum before stability. But I also heard Eugene say
22 earlier one percent. Can you just enlighten me on what
23 one percent or two percent means and why is it kicked
24 around with regard to modifications or stability, dead
25 weight?

1 MR. SCHILLING: It relates to whether a new
2 inclining that needs to be done to establish the
3 vessel's light ship weight. And the Coast Guard has a
4 NAVIC, Navigation Inspection Circular, that defines
5 when a dead surveyor or an inclining needs to be done
6 on a ship and when you're considering a modification or
7 modifications have been done on the ship since the last
8 inclining. When the aggregate weight change approaches
9 two percent of the light ship weight, you have to start
10 considering whether a new dead weight survey or a
11 inclining needs to be done.

12 I think up to two percent you can rely on
13 calculations. If the weight is significant, you can
14 rely on calculations to update the light ship weight
15 and the CG. If it's over two percent, you have to
16 consider a formal dead weight survey to verify the
17 light ship weight and LCG.

18 If after having done the dead weight survey
19 which is just reading drafts and surveying the vessel
20 for weights to add and deduct from light ship, you
21 determine that the measured light ship weight agrees
22 within I think one percent of the estimated light ship
23 weight after you've added all the changes in. Then you
24 can use the calculated VCG for the light ship center of
25 gravity, vertical center of gravity.

1 If you don't meet or if your estimated light
2 ship weight is more than one percent then the light
3 ship should be determined from the dead weight survey.
4 You have to go ahead and complete the inclining to
5 determine the light ship VCG.

6 MR. STOLZENBERG: Okay. So if I understand
7 it correctly, if a modification is made to a vessel
8 that's either plus or minus two percent of its light
9 ship weight, calculations are done. And a dead weight
10 survey can be done. If the dead weight survey
11 performed matches the calculations within one percent,
12 then a new inclining does not have to be performed. If
13 it's outside of that, then an inclining would have to
14 be performed. Okay. Thank you.

15 MR. STETTLER: Can I ask a related question?
16 Jeff Stettler. Could you state if you know under what
17 condition or situation could you use inclining data
18 from a sister vessel to determine light ship
19 characteristics of another vessel?

20 MR. SCHILLING: That kind of thing is often
21 done at new building stage for sister vessels. It
22 depends on the type of vessel.

23 I don't recollect what regulation or
24 requirement spells out when that's acceptable and when
25 it can be used. Sometimes a dead weight survey is done

1 for all the vessels and they will apply the VCG to the
2 sister vessel. Sometimes they'll apply both the light
3 ship weight and the center of gravity to sister
4 vessels. And sometimes they incline each individual
5 vessel. I'm not sure if there's a regulation that
6 specifies that specifically should be done.

7 MR. VAN RYNBACH: This is Eugene. I think
8 when new ships are built, the builder applies to the
9 Classification Society. And he requests that the first
10 ship inclined dead weight and then the Classification
11 accept that the sister ships built to the same plans.

12 Normally, it's just a dead weight survey.
13 They just confirm that the light ship weight is similar
14 to the first ship. And based on that, the
15 Classification will allow them to use the vertical
16 center of gravity from the first ship for the follow-on
17 ships that are built essentially to the same drawings.
18 So there is some sort of a ruling made to accept that.

19 MR. STETTLER: Jeff Stettler again. Eugene,
20 is that a NAVIC or some other document that you're
21 aware of?

22 MR. VAN RYNBACH: It could be in SOLAS as
23 well and Load Lines. And it could be in Coast Guard.
24 Probably Subchapter S, Stability.

25 MR. STETTLER: Okay.

1 MR. VAN RYNBACH: I don't know the
2 regulation.

3 MR. STETTLER: Thank you.

4 MR. GRUBER: Tom Gruber. Just to go back,
5 you talked about major modification requests going from
6 the owner to the Coast Guard. Would the decision for
7 dead weight or inclining or detailed weight calculation
8 be made in the same manner? And, if not, how do you go
9 about getting that determination?

10 MR. SCHILLING: On who checks whether the
11 aggregate weight change is enough to implement, that
12 can be a discussion depending on how the ship is
13 classed and flagged and whether in U.S. it's an ACP
14 sort of situation. That can be a discussion with Class
15 where the weight changes. When a modification is done,
16 Class will often ask the question "What's the total
17 aggregate weight change?" And we'll indicate that a
18 dead weight incline is required if you're approaching
19 that two percent threshold.

20 MR. GRUBER: Tom Gruber, a follow-up.
21 That's not connected to whether or not it's a major
22 modification. You could still be required to do some
23 kind of a stability test even if it's not a major
24 modification.

25 MR. SCHILLING: That's correct.

1 MR. GRUBER: Thank you.

2 MR. STOLZENBERG: Dennis, anything?

3 MR. O'MEARA: No questions.

4 MR. STOLZENBERG: Mike on the phone along
5 these lines?

6 MR. KUCHARSKI: I'm okay. Thank you.

7 MR. STETTLER: One very simple question,
8 Eric, related. Jeff Stettler, Coast Guard. Do you
9 know what year Herbert Engineering began work on the El
10 Faro?

11 MR. SCHILLING: It would have been 2005.

12 MR. STETTLER: Five. Just before the
13 modification.

14 MR. SCHILLING: That was our first job with
15 it.

16 MR. STETTLER: Okay.

17 MR. SCHILLING: Was the conversion.

18 MR. STETTLER: So you didn't have any
19 involvement in 2003 and 2004 time frame in any of the
20 decisions or predesign/concept design related issues or
21 modification -- I should say -- with the El Faro in
22 preparation for that conversion.

23 MR. SCHILLING: This is Spencer. I don't
24 recollect the precise date when we started. I mean I
25 think our first involvement with the El Faro with the

1 Northern Lights at the time --

2 MR. STETTLER: Right.

3 MR. SCHILLING: -- was for this conversion.
4 At what point we got into it with the discussion with
5 TOTE and what they'd already done I don't recall.

6 MR. STETTLER: Okay. Thank you.

7 MR. STOLZENBERG: That falls into another
8 topic I wanted to speak to briefly. What major
9 products did Herbert Engineering provide for TOTE and
10 SeaStar in general and over about what time frame?
11 Briefly.

12 MR. SCHILLING: I mean I think -- this is
13 Spencer -- the first thing I can recollect or find in
14 our files really with involvement with TOTE at all is
15 in early 2000-2001 maybe when we did some evaluation
16 for them on their ORCA (phonetic) class containerhips
17 which they're currently getting designed by NASCO. So
18 we did some early work with them on stability, damage
19 stability, for those ships.

20 But up until then, we hadn't had any
21 involvement with TOTE. And then I think this job on
22 the Northern Lights was the first main project we had.

23 MR. STOLZENBERG: And earlier when you
24 described what Herbert could handle, it was a vast
25 array of Naval architecture marine services. What was

1 the nature of these products for TOTE and SeaStar?

2 MR. SCHILLING: Do you mean the projects?

3 MR. STOLZENBERG: Yes. What projects were
4 they?

5 MR. SCHILLING: Well, again I think the -- I
6 have to correct now because we're talking Northern
7 Lights and that was 2005. In 2003, it was the Great
8 Land would have been the first row-row. So the Great
9 Land was a similar ship. And it went through the same
10 deck container conversion.

11 MR. VAN RYNBACH: This is Eugene. Just
12 maybe I can clarify a little bit. The Great Land was a
13 candidate for this conversion initially. And then I
14 think TOTE in 2005 switched to the Northern Lights.

15 The Great Land and the Northern Lights were
16 two sister ships running between Tacoma and Alaska,
17 Anchorage, Alaska for many years for TOTE. But then
18 they built these replacement ships called ORCA class.
19 We were coming on line. So these ships became surplus,
20 the Great Land and the Northern Lights.

21 They needed an extra ship in this Florida to
22 San Juan service. So the idea was to convert one of
23 these to be the same as the two existing ships that
24 were in that service. So they would have three ships
25 all with the same configuration.

1 MR. STOLZENBERG: And the third ship being?
2 This is Eric Stolzenberg.

3 MR. VAN RYNBACH: Well, there's the El
4 Morro, El Yunque that were existing in those services.
5 So the third ship would be either the Northern Lights
6 or the Great Land. And in 2005 it became the Northern
7 Lights which was renamed in early 2006 to El Faro.

8 MR. STOLZENBERG: Okay. Thank you.

9 MR. VAN RYNBACH: And just a little more
10 follow-up because this office was more involved on some
11 of the small projects for SeaStar. We periodically
12 assisted them with evaluating deck strength for
13 specific heavy cargo. When they carried a big cargo
14 that weighed 50 or 60 tons, we would advise them on the
15 securing/lashing of that cargo and whether the deck was
16 strong enough.

17 We also designed a portable ramp so that
18 they could carry military cargo, tanks and so forth.
19 It turned out that there wasn't so much need for this
20 ship in that service, the El Faro after it was
21 converted. So it was -- TOTE can correct me on this --
22 offered into charter to MSC, the Military Sealift
23 Command, from time to time. So they needed a portable
24 ramp to carry military cargo. We designed that
25 portable ramp for them. And we did one or two other

1 minor projects.

2 MR. STOLZENBERG: And that would be Herbert
3 Engineering.

4 MR. VAN RYNBACH: That would be Herbert
5 Engineering, yes.

6 MR. STOLZENBERG: And that would include the
7 T&S booklet for the El Faro we talked about earlier.

8 MR. VAN RYNBACH: That's for the conversion
9 in 2005-2006.

10 MR. STOLZENBERG: Okay. Thank you.

11 MR. VAN RYNBACH: A modification. It really
12 wasn't a conversion, yes.

13 MR. GRUBER: Tom Gruber. Did you do any of
14 the stability work on the El Morro and El Yunque for
15 the Florida/Puerto Rico trade?

16 MR. VAN RYNBACH: No. This is Eugene. They
17 had CargoMax programs. But we did not do the stability
18 booklet.

19 MR. STOLZENBERG: This is Eric Stolzenberg
20 again. So this speaks to what you both had mentioned
21 earlier is that the CargoMax side, the Herbert Software
22 Solution side, is a different entity than the Herbert
23 Engineering side which does the T&S booklet. And even
24 though you weren't doing the T&S booklets for the El
25 Yunque and the El Morro, Herbert Software Solutions was

1 doing the CargoMax loading applications for those other
2 vessels.

3 MR. SCHILLING: Yes. This is Spencer.
4 That's correct.

5 MR. STOLZENBERG: Thank you. That makes it
6 much clearer now. Any other questions along these
7 lines?

8 MR. STETTLER: Jeff Stettler. I've got a
9 related question. Who at TOTE, either organizationally
10 or by name, did you typically interact with during the
11 early, say, from 2005 to 2006? Who were your technical
12 representatives at TOTE? Who did you deal with on
13 technical matters?

14 MR. VAN RYNBACH: Do you want me to answer?

15 MR. SCHILLING: Yes.

16 MR. VAN RYNBACH: I can answer. This is
17 Eugene. I can answer for SeaStar because at that period
18 in time SeaStar was a separate entity that managed the
19 ships in the Florida/Puerto Rico service. It started
20 out as a joint venture between Matson and TOTE I
21 believe. And then Matson no longer was involved at
22 some point.

23 But it was still -- It had a separate
24 president and a separate organization structure in
25 Jacksonville, SeaStar Line. So most of our work was

1 with SeaStar Line and the people we worked with were
2 William Weisenborn, W-E-I-S-E-N-B-O-R-N. He was like
3 marine operations manager. And before him was Steve
4 Tornello, T-O-R-N-E-L-L-O. And then there was Jim
5 Coleman, C-O-L-E-M-A-N. He was the marine
6 superintendent, the repair superintendent.

7 Those are the three people that we dealt
8 with at SeaStar. We didn't deal that much with TOTE
9 Tacoma. Normally, all our interactions were with
10 Jacksonville.

11 MR. STETTLER: So all three of these then
12 were from Jacksonville.

13 MR. VAN RYNBACH: Yes. And then I guess
14 Dennis -- It was about 2009-2010 when TOTE decided to
15 consolidate their operations into Tacoma. And so all
16 the marine operations were not run so much out of
17 Jacksonville. All those people I mentioned left
18 SeaStar and TOTE in Tacoma took over direct management
19 of those ships.

20 MR. STETTLER: Is there a particular
21 organization or part of the organization in Tacoma that
22 you interacted with even up through 2015 other than the
23 port engineers? I guess that's really my question.
24 Who else at TOTE other than the port engineers did
25 Herbert Engineering interact with in dealing with trim

1 and stability books and general drawings and the like?

2 MR. SCHILLING: This is Spencer. I think in
3 terms of the detailed engineering side most of it was
4 handled by the staff in Jacksonville.

5 MR. STETTLER: Port engineer staff?

6 MR. SCHILLING: Or the manager staff that
7 was down in Jacksonville. In Tacoma, two of the people
8 we dealt with I think throughout our involvement with
9 TOTE were Phil Morrell. The last name is M-O-R-R-E-L-
10 L.

11 MR. STETTLER: He's in Tacoma.

12 MR. SCHILLING: Yes. And also we had some
13 correspondence with Rich Griffith. But they weren't
14 involved in the day to day aspects of the Northern
15 Lights/El Faro modification. But we have dealt with
16 them more recently on El Faro issues in projects they
17 were considering doing.

18 MR. O'MEARA: This is Dennis. Phil Morrell
19 is the VP for Marine Operations, commercial side. So
20 he oversees both the west coast TOTE commercial stuff
21 and the east coast stuff which would include
22 Jacksonville and San Juan run. He has responsibility
23 for that.

24 MR. STETTLER: Okay.

25 MR. VAN RYNBACH: This is Eugene. Just to

1 go a little more, after the operation moved more to
2 TOTE Tacoma, we had less involvement with the ships.
3 So the last five years we just had one or two projects,
4 one being the fructose tanks.

5 Also I should mention that at one point we
6 designed replacement ships for the Florida to Puerto
7 Rico service for SeaStar. So we prepared like a
8 concept design for new ships for them in 2010 and 2011.
9 But then when this consolidated -- the SeaStar separate
10 organization was ended, that project ended. And it was
11 taken over by TOTE in Tacoma and then our involvement
12 ended.

13 MR. STETTLER: Thank you. Jeff Stettler
14 again. Just to follow up, what I'm after is I'm really
15 trying to understand TOTE's organization. Do they have
16 Naval architects for example or folks that you dealt
17 with who understood ship stability matters and ship
18 structure matters for example? Or were you the Naval
19 architects for TOTE?

20 MR. SCHILLING: This is Spencer. On
21 projects they asked us to work on, we would handle the
22 stability and the strength issues. That's why they
23 came to us, those kinds of things.

24 MR. STETTLER: Right.

25 MR. SCHILLING: But in terms of overall

1 oversight responsibility for stability and things like
2 that for TOTE, that was not our role. So if there was
3 a modification they asked us to make or something, we
4 would make sure we checked what needed to be checked
5 for stability or strength and things like that, get the
6 drawings approved, do the calculations necessary to get
7 the modifications done.

8 MR. STETTLER: So just to clarify as far as
9 you know, did you ever work with a degreed Naval
10 architect who was employed by TOTE?

11 MR. SCHILLING: This is Spencer. I don't
12 have a recollection of working with a Naval arch at
13 TOTE.

14 MR. STETTLER: Okay. Thank you.

15 MR. STOLZENBERG: This is Eric Stolzenberg.
16 I'd like to follow up along the same lines. Did
17 Herbert have an RRDA or the rapid response and damage
18 assessment contract with TOTE or El Faro specifically?

19 MR. SCHILLING: No. This is Spencer. No,
20 we did not.

21 MR. STOLZENBERG: Were you contacted after
22 the sinking to do any stability work or assessments?

23 MR. SCHILLING: This is Spencer.
24 Immediately after the report, our software group
25 received a call from ABS RRDA group to help them answer

1 some questions about calculations that ABS's RRDA group
2 was doing with HECSALV. That would be a normal support
3 function that the software group would do. So if
4 there's questions about what the software is doing or
5 how to use it for a particular application, the
6 software group would get a call from ABS RRDA group and
7 the other salvage organizations that would be using it.

8 MR. STOLZENBERG: Okay.

9 MR. SCHILLING: And there was a call placed
10 at that point. But there was no request for any
11 analysis. We didn't do any analysis on the condition
12 or anything like that and Herbert Engineering wasn't
13 involved.

14 I heard when the phone call came in that
15 there were some questions about the ship configuration
16 at the time. So I offered to at least explain what the
17 ship looked like to the ABS RRDA group because they
18 hadn't personally seen it and were uncertain about the
19 arrangement. So I got on the phone and at least
20 explained to them about the arrangement of the El Faro
21 and the row-row decks and the second deck and things
22 like that. That was all.

23 PARTICIPANT: May I interrupt here just from
24 an organizational issue? Would you like to have lunch?
25 We would need to call ahead. Next door there's a

1 restaurant. So we can get a table there if you'd like.
2 Do you want to take a break at 12:30 p.m.? It's 11:30
3 a.m. now. Or if you'd give me a time I can arrange
4 lunch.

5 MR. STOLZENBERG: Yes. This is Eric
6 Stolzenberg. I was thinking we would take a break
7 because we're just over an hour anyways. And we'd go
8 off the record and come back on the record once we
9 clear a topic. So if we can clear this topic, we'll go
10 off the record and discuss any arrangements in the
11 afternoon.

12 PARTICIPANT: Okay. I'm sorry.

13 MR. STOLZENBERG: And we'll go from there.
14 But, yes, thank you very much for the suggestion and
15 we'll get there.

16 PARTICIPANT: Yes.

17 MR. STOLZENBERG: Any other questions on
18 this topic here? At the table I'll start with.

19 MR. GRUBER: Tom Gruber from ABS. Just to
20 clarify, the ABS Rapid Response RRDA team is part of
21 the ABS Class, not the group of companies. So it's
22 separate from the group and separate from the ABS
23 Herbert joint venture.

24 MR. STOLZENBERG: Mike on the phone?

25 MR. KUCHARSKI: Nothing. Thank you.

1 MR. STOLZENBERG: Okay. What do you say we
2 go off the record for five minutes and we'll come back
3 on. We're going off. The time now is 11:31 a.m. Off
4 the record.

5 (Whereupon, the above-entitled matter went
6 off the record at 11:31 a.m. and resumed at 11:51 a.m.)

7 MR. STOLZENBERG: On the record. This is
8 Eric Stolzenberg. It's 11:51 a.m. at Herbert
9 Engineering offices in Annapolis. We're continuing
10 with the interviews of Misters Spencer Schilling and
11 Eugene van Rynbach.

12 This is Eric Stolzenberg. My question is
13 does Herbert provide any products regarding the load
14 lines? Or I know ABS and Class do load lines. What is
15 the role of an independent naval arch firm with load
16 lines for a Class vessel?

17 MR. SCHILLING: This is Spencer. We might
18 work if an owner has a request -- Load line assignment
19 comes from Class. We can provide engineering backup
20 calculations and things like that to justify an
21 increase if we feel one is deserved for a load line
22 change or a load line assignment. But the load line
23 assignment comes from Class or Flag administration.

24 MR. STOLZENBERG: Okay. How are hull
25 openings treated in load line rules? Let me back up a

1 moment. Are you familiar with load line calculations
2 and load line assessments?

3 MR. SCHILLING: Generally yes.

4 MR. STOLZENBERG: Okay. With that in mind,
5 to your knowledge, how are openings in the hull treated
6 for load lines?

7 And further to the point, a down flooding
8 point to my knowledge is the first portion of the hull
9 which will be submerged when a vessel keels over. So
10 what I'm looking for is how are openings in the hull
11 treated for load lines and if you're aware of the down
12 flooding point for the El Faro or where we can find it.

13 MR. SCHILLING: This is Spencer. These
14 ships have a standard B load line assignment. And I
15 think as part of that down flooding point should have
16 been noted as part of the load line assignment. But I
17 don't know if there's a requirement of any calculations
18 that go with that down flooding point.

19 As a standard B dry cargo ship, there would
20 not have been any damage stability requirements as part
21 of the load line calc.

22 MR. STOLZENBERG: What does a standard B
23 refer to?

24 MR. SCHILLING: In the load line rules,
25 there is type A and type B ships. Type A ships are

1 basically tankers. Type B is dry cargo and bulk and
2 dry bulk carriers.

3 MR. STOLZENBERG: Okay. And if I could go
4 back to the hull openings, what's the definition of a
5 down flooding point to your knowledge with regard to
6 load line assignment? Ask me to rephrase if I'm not
7 being clear.

8 MR. SCHILLING: Well, there's protected
9 openings and unprotected openings.

10 MR. STOLZENBERG: Okay.

11 MR. SCHILLING: The unprotected or non
12 protected openings are ones which have no weather tight
13 closure and usually the regulations, whether it's
14 damage stability regulation or such, it cannot be
15 submerged at -- Well, an unprotected opening has
16 nothing to prevent the water from flowing down into the
17 ship into a watertight compartment.

18 The weather tight opening is one that's
19 protected by some sort of ball-check valve or other
20 such things that prevents water from coming in when
21 there's an occasional wave passing or rain or other
22 water on deck from getting into the hull. But it will
23 not take a head. So any head of water if it's
24 permanently submerged equilibrium it's not watertight.
25 It only prevents the occasional passing of water from

1 entering through that down flooding point.

2 Whereas, an unprotected opening has no
3 protection whatsoever. So any occasional passing of
4 water could enter the ship through that opening.

5 MR. STOLZENBERG: And then that would leave
6 a protected opening and what is that?

7 MR. SCHILLING: A protected opening is not
8 an opening at all. Essentially, it's a water-tight
9 closure in compliance.

10 MR. STOLZENBERG: Okay. So that might be?

11 MR. SCHILLING: So a manhole or a bolted,
12 proper watertight hatch or a cover plate or something
13 like that.

14 MR. STOLZENBERG: Okay. With regard to the
15 El Faro and the sister vessels we spoke of earlier, the
16 ventilation openings on the side, what are those
17 treated as for the load line to your knowledge?

18 MR. SCHILLING: I don't know if we've seen
19 any list of down flooding points related to load line.
20 It's our understanding that for the damage stability
21 assessment the ventilation openings would be a point of
22 down flooding for the survival criteria and the
23 survival analysis.

24 MR. STOLZENBERG: You said would be?

25 MR. SCHILLING: There would be certainly.

1 The damage stability includes both the weather tight
2 closure and an unprotected opening.

3 MR. VAN RYNBACH: This is Eugene. Many
4 times with the load line certificate there is a
5 reference document that lists all the openings on the
6 freeboard deck whether they're protected. It lists all
7 the vents and so forth.

8 The ship maybe because it's aged, I don't
9 know. But that's typical. I don't know if you've
10 found that document. It may be at ABS. It's usually
11 associated with the load line. There's a reference
12 document which lists all the vents on deck and all the
13 openings.

14 MR. STOLZENBERG: Thank you. So in the case
15 of the El Faro, we walked the sister vessel, the El
16 Yunque. There are fire dampers on the ventilation
17 openings for exhaust and inlet. What are those fire
18 dampers typically -- What would those typically be
19 included as in the load line? Is that weather tight,
20 protected, unprotected or does it depend on their
21 height above the water line or placement of the vessel?

22 MR. SCHILLING: This is Spencer. I think it
23 depends on the nature of the damper itself if it can
24 withstand an occasional passing of water without
25 penetration. It doesn't have to support a head of

1 water. But normally for things like ventilation
2 louvers like for instrument intakes and things like
3 that, they would not be considered a protected opening,
4 a weather tight opening. They would be considered an
5 unprotected opening.

6 I'm not familiar with the particular types
7 of fire dampers that are actually internal to this.
8 That's why we would have considered just looking at the
9 -- Well, considering these ventilation openings to our
10 understanding the down flood point was controlled by an
11 internal baffle above the actual or at the actual
12 opening.

13 MR. FRANCE: Willa France. Just for
14 clarification, this and these are referring to a sketch
15 or a drawing for the El Faro. Yes?

16 MR. STOLZENBERG: That's correct. This is
17 Eric Stolzenberg. We have a drawing on the wall of air
18 holes number 2A and 3 from ABS. And we were looking at
19 the typical -- This is a Sun Ship building drawing of
20 ventilation arrangement of holes two and three, drawing
21 number C6877-2A Alt. C.

22 MR. FRANCE: Great.

23 MR. VAN RYNBACH: Also just to clarify --
24 this is Eugene -- this drawing was modified when the
25 ship was lengthened in 1993. So it also has a JJH

1 title block and with a similar title but a different
2 drawing number 1252877-2A.

3 MR. SCHILLING: This is Spencer again.
4 Maybe at that time that work in 1993 was a major
5 conversion when the midbody was added. Any
6 requirements for damage stability perhaps were
7 evaluated at that time on that work and the down
8 flooding points identified with that effort. There was
9 an indication on the T&S booklet from that era that
10 indicated that SOLAS damage stability chapter 2-B1 Reg.
11 25 was evaluated. And there might be some
12 documentation on that with regard to down flooding
13 points and things like that.

14 MR. VAN RYNBACH: This is Eugene. That may
15 have been at ABS. Has ABS searched its records for
16 that?

17 MR. STOLZENBERG: This is Eric Stolzenberg.
18 We have a fair number of -- And we definitely
19 appreciate hearing where to look for certain documents.
20 We do have a fair number of documents from ABS. I
21 can't say offhand whether we have it, but there's
22 probably a good chance that we do.

23 MR. GRUBER: Being the interviewer here I
24 don't know that it's -- Unless you're interviewing me,
25 I don't know that it's an appropriate time for ABS to

1 be answering questions like that.

2 MR. STOLZENBERG: That's okay. We know the
3 source document.

4 MR. GRUBER: Eric, I actually do have a
5 question. We do have some documentation related to the
6 1993 conversion and there having been done a damage
7 stability analysis for that.

8 MR. STOLZENBERG: Okay.

9 MR. GRUBER: But I have a related question
10 to that. To your knowledge as a naval architecture
11 firm, if you were modifying a vessel such as a load
12 line increase to this situation, would you consider
13 that a damage stability analysis should be done again
14 considering the new load line as opposed to an old load
15 line?

16 MR. SCHILLING: This is Spencer. That's
17 something you consider and look at whether a damage
18 stability assessment is necessary. In this case again
19 we had the existing ship that we started with which
20 apparently had a damage stability assessment done. So
21 it was sailing with an approved damage stability
22 evaluation and consideration. We weren't changing
23 anything else in the cargo deck modifications that we
24 did that would have affected that in terms of we didn't
25 change the down flooding points or the hull buoyance

1 here or subdivision.

2 And then looking at the changes to load line
3 and also permanent ballast installation, it was making
4 it just like the other ships, the El Morro and the El
5 Yunque. And it was our understanding that one of the
6 down flooding points would have been sufficient for the
7 El Faro or Northern Lights when it was converted in
8 '93. And the load line and the permanent ballast
9 installation made it identical to essentially the El
10 Morro and the El Yunque in configuration and load line
11 and everything else. And that one has apparently
12 approved damage stability as well.

13 MR. VAN RYNBACH: At the new load line.
14 This is Eugene.

15 MR. SCHILLING: At the new load line.

16 MR. STOLZENBERG: Okay.

17 MR. SCHILLING: And in fact the load line
18 that was assigned for the El Faro mentioned that it was
19 similar to the El Yunque and El Morro. So it didn't
20 appear to us there was a need for validating the damage
21 stability.

22 MR. STETTLER: Jeff Stettler again. Just to
23 confirm, you believe that there was a statement made in
24 an ABS document that allowed use of the sister vessel
25 damage stability analysis to be used for the El Faro at

1 its new load line in 2006. Is that correct?

2 MR. SCHILLING: I can't recollect if there's
3 a statement from ABS that says that the damage
4 stability assessment can be applied.

5 MR. STETTLER: But that was your assumption
6 that this was done.

7 MR. SCHILLING: Well, in terms of the load
8 line, there was a reference that the load line was
9 approved in part because it was the same load line that
10 the El Yunque and El Morro were sailing with. And the
11 ships were similar.

12 MR. STETTLER: Okay.

13 MR. VAN RYNBACH: Excuse me. This is
14 Eugene. We have a document with the load line
15 assignment from ABS mentioning that. Should we produce
16 that document?

17 MR. STOLZENBERG: Is it a document we have
18 also?

19 MR. STETTLER: I don't know if we do have it
20 not.

21 MR. STOLZENBERG: Yeah, I think we can --
22 We'll continue.

23 MR. VAN RYNBACH: Okay. I have it right
24 here.

25 MR. STETTLER: After lunch we can --

1 MR. STOLZENBERG: Thank you. Let's go off
2 the record for a moment and get the document and we'll
3 come right back on.

4 (Whereupon, a short recess was taken.)

5 MR. STOLZENBERG: We're back on the record
6 at 12:09 p.m. with Herbert Engineering.

7 MR. STETTLER: This is Jeff Stettler. I've
8 got a couple of questions as a follow-up regarding the
9 load line assignment and potentially its connection to
10 the damage stability analysis. We have observed a
11 document which is an ABS letter.

12 MR. STOLZENBERG: Yes, dated 29 December
13 2005 to Herbert Engineering from ABS regarding Northern
14 Lights ID 7500285 Sun Hull 6781966 Load lines
15 preliminary freeboard assignment.

16 PARTICIPANT: Provided just now by Herbert.

17 MR. STOLZENBERG: Provided just now by Mr.
18 Eugene van Rynbach here at Herbert.

19 MR. STETTLER: So the question -- And we're
20 also looking at the 2006 load line certificate dated --
21 I'm looking for a date on this --

22 PARTICIPANT: The fourth page.

23 MR. STETTLER: Fourth page.

24 PARTICIPANT: No, second page. Sorry.

25 MR. STETTLER: There we go. Yes. Oh, valid

1 until. So completion date, 27 February 2000 --

2 PARTICIPANT: No, issue date is 29 January
3 2011.

4 MR. STETTLER: Oh, issue date is 29 January
5 2011 by Robert Neil Powell from Mobile ABS Surveyor.
6 So the question is that the referenced letter from 2005
7 which talks about a preliminary freeboard assignment of
8 a Type B load line is based on a sister vessel, the El
9 Morro, Hull 666 and that it assigns the preliminary
10 load or preboard -- excuse me -- of 12 feet 5/16ths of
11 an inch which corresponds to a load line extreme draft
12 of 30 feet, 2-3/8ths inches which is the current and
13 also referenced on the load line certificate we just
14 mentioned.

15 So the question for Herbert Engineering just
16 in your opinion or based on your experience is would
17 you expect that a damage stability analysis would have
18 been done to support the load line assignment, any load
19 line assignment but a change in load line, for the El
20 Faro or the Northern Lights at the time which
21 effectively increased the load line by two feet? Would
22 you have expected a damage stability analysis to
23 support that?

24 MR. SCHILLING: This is Spencer. I think
25 our -- I'm trying to recollect what our thought was at

1 the time. The changes that are being made to the
2 vessel were being made to make them similar in
3 arrangement to the sister ships. So just like there's
4 occasions when you can apply light ship weight and CGs
5 from a sister vessel to another vessel in that class,
6 it appears to us that the damage stability assessment
7 that would have justified or that might have been done
8 for the increased load line or the permanent ballast
9 was in place with the sister vessels. Therefore, it
10 would apply. We're going for the same load line and
11 same permanent ballast installation for the El Faro.
12 So there wouldn't necessarily need to be a new
13 validation of that assessment.

14 MR. STETTLER: So to your knowledge then --
15 Jeff Stettler again -- there would have been for you to
16 reach that conclusion a damage stability analysis on a
17 sister vessel at the same load line. Is that correct?

18 MR. SCHILLING: Yes. In the T&S booklet for
19 the El Yunque and El Morro, there's a statement in
20 INTACT stability required GM page that says the INTACT
21 required GMs -- I'm paraphrasing -- on this page are
22 more conservative than the dynamic and damage stability
23 requirements.

24 So taking that information it appears that a
25 damage stability assessment was done. We weren't

1 involved in that. We weren't involved in the T&S book
2 at the time. It was a different owner. With that
3 evidence, something had been done as well. And again
4 we were just applying the same load line.

5 MR. STETTLER: Okay. This is Jeff Stettler.
6 So just for the record, Mr. Stolzenberg, I think that
7 means that we need to request documentation on the El
8 Morro or the El Yunque to verify that that damage
9 stability analysis supports that load line assignment
10 for those vessels which were then utilized.

11 MR. SCHILLING: This is Spencer. But again
12 as part of load line, there was no damage stability
13 requirement.

14 MR. STETTLER: Right. I guess I should
15 restate that. Not necessarily for the draft of 30 feet
16 2-3/8ths inches. I think there would be a damage
17 stability analysis which would demonstrate that the
18 limiting GM criteria is in fact the weather criteria
19 and not the damage criteria. Is that correct?

20 MR. VAN RYNBACH: This is Eugene. Under
21 load line regulations, I don't believe it's a
22 requirement. The load line regulations if you're a
23 type B freeboard you're not required to do a damage
24 stability analysis. It's under other requirements.

25 MR. STETTLER: Right. But again I get back

1 -- Jeff Stettler again -- to limiting the required GM
2 curve which Mr. Schilling just mentioned has a
3 statement stating that the limiting GM criteria is the
4 weather criteria and therefore not the damage condition
5 criteria. In order to verify that that's indeed the
6 case, I would think that a damage stability assessment
7 would have been required to reach that conclusion.

8 MR. SCHILLING: Required or performed.

9 MR. STETTLER: Performed, right. Exactly.

10 MR. SCHILLING: But not as a requirement of
11 the load line.

12 MR. STETTLER: Correct, yes.

13 MR. SCHILLING: So it wasn't related to the
14 load line.

15 MR. STETTLER: Directly. But at that draft
16 of the load line which the vessel would operate.

17 MR. SCHILLING: Right. So if you're going
18 to say that in T&S booklet that the damage stability
19 criteria is less severe than the INTACT wind
20 (Inaudible) criteria.

21 MR. STETTLER: Right.

22 MR. SCHILLING: You would assume it had been
23 checked at the draft or whatever damage stability
24 requirement required the draft to be checked at.

25 MR. STETTLER: Okay. Thank you.

1 MR. STOLZENBERG: This is Eric Stolzenberg.
2 Before we continue on this topic, what I'm going to
3 call Exhibit A which is what Mr. van Rynbach brought
4 into the room after the break is an ABS Americas
5 telefax with a preliminary freeboard assignment dated
6 29 December 2005 for the Northern Lights ID 7500285.
7 And we'll call that Exhibit A.

8 (Whereupon, the above-referred to
9 document was marked as Exhibit A
10 for identification.)

11 PARTICIPANT: And just actually write
12 Exhibit A on it and put your initials.

13 MR. STOLZENBERG: Understood.

14 PARTICIPANT: We will make photocopies.

15 MR. STETTLER: Just for process you're doing
16 that because we don't already have the document.

17 MR. STOLZENBERG: That's correct. It's been
18 introduced.

19 PARTICIPANT: You don't know whether you
20 have it.

21 MR. STOLZENBERG: This is Eric Stolzenberg.
22 It's been introduced here today in case we do not have
23 it.

24 MR. STETTLER: So this one we don't have to

25 --

1 PARTICIPANT: We actually have that document
2 as well.

3 PARTICIPANT: We have it.

4 PARTICIPANT: Yes.

5 PARTICIPANT: Now you've got more.

6 MR. STOLZENBERG: And we can continue on
7 with the discussion and additional questions.

8 MR. GRUBER: Tom Gruber. You said that the
9 indication on the GM curve from the El Yunque and the
10 El Morro T&S booklet indicated that it met a damage
11 stability requirement.

12 MR. SCHILLING: Yes. That's the way I took
13 that statement to read. It didn't say what damage
14 stability requirement was meeting. It just said that -
15 - I'm paraphrasing from recollection again -- the
16 damage stability required GM was less than the wind
17 heel INTACT stability criteria that's in the T&S
18 booklet. The implication is that if you meet that
19 INTACT requirement you would also meet the damage
20 stability requirement.

21 MR. GRUBER: Did you verify what damage
22 requirement that the El Yunque and the El Morro would
23 have met?

24 MR. SCHILLING: No, I did not.

25 MR. GRUBER: Okay. So you don't know for

1 sure if that was the same damage requirement that the
2 El Faro was required to meet.

3 MR. SCHILLING: I do not.

4 MR. GRUBER: Okay. Do you have a copy of
5 the El Yunque and El Morro T&S booklet in your files?

6 MR. SCHILLING: Yes. We have one from 2001
7 which I believe is the current one.

8 MR. GRUBER: Is it permissible to ask to
9 have that brought in since that's what the questioning
10 referred to?

11 MR. STOLZENBERG: Absolutely. If we would
12 like to go off the record and --

13 MR. SCHILLING: I don't know if I have it
14 here.

MR. VAN RYNBACH: We have it.

15 MR. SCHILLING: Oh, do you? Okay.

16 MR. GRUBER: If we could.

17 MR. STOLZENBERG: So for a moment we'll go
18 back off the record and obtain an additional T&S
19 booklet and return. Off the record.

20 (Whereupon, a short recess was taken.)

21 MR. STOLZENBERG: Back on the record at
22 12:23 p.m. at Herbert Engineering. Mr. van Rynbach has
23 brought in a trim and stability booklet for the SS El
24 Yunque stamped by ABS 2 February 2001. We're going to
25 call that Exhibit B.

1 (Whereupon, the above-referred to
2 document was marked as Exhibit B
3 for identification.)

4 And Tom Gruber will continue.

5 MR. GRUBER: Okay. On page 12 is the wind
6 heel required metacentric height and towards the bottom
7 of the page it states, "These requirements exceed
8 dynamic stability and damage stability requirements."
9 There's no reference in the booklet what damage
10 stability requirements or criteria that this refers to.
11 Is that a fair statement?

12 MR. SCHILLING: That's our understanding,
13 yes.

14 MR. STOLZENBERG: And I'll invite to go
15 around again regarding load line/damage stability
16 assessments, previous vessels, along this topic.

17 Mike, do you have anything on the phone?

18 (No verbal response)

19 Mike?

20 MR. KUCHARSKI: Hello.

21 PARTICIPANT: He was on mute.

22 MR. STOLZENBERG: Mike, this is Eric
23 Stolzenberg. Do you have any questions regarding load
24 line and damage stability assessments on the topic
25 we've been discussing?

1 MR. KUCHARSKI: Not on the direct topic, no.
2 I do have questions about the T&S book.

3 MR. STOLZENBERG: Dennis? Tom?

4 MR. GRUBER: No.

5 MR. STOLZENBERG: Jeff?

6 MR. STETTLER: No additional questions.

7 MR. STOLZENBERG: Okay. Then, Mike, why
8 don't we move onto your questions on the T&S book?

9 MR. KUCHARSKI: Okay. Just a quick one on
10 the T&S book, the instructions in there. Was anything
11 updated on that for the containers, the addition of the
12 weights up high?

13 MR. STOLZENBERG: And to be clear, Mike,
14 what you're discussing is the El Faro T&S booklet.

15 MR. KUCHARSKI: Yes.

16 MR. STOLZENBERG: The latest version.

17 MR. VAN RYNBACH: We've got a copy.

18 MR. SCHILLING: We have it right here.

19 MR. STOLZENBERG: Let us break out our copy.
20 So we're looking at February 14, 2007 entitled Final
21 T&S Booklet for the SS El Faro, ABS approved stamped
22 version on May 31, 2007.

23 MR. SCHILLING: This is Spencer. So the
24 revisions to the T&S booklet were done at the time of
25 the modifications to the deck cargo. We were to add

1 the stowage locations and arrangement of the container
2 cargo and provide a means and provide reference
3 information for weight and CG tabulation to allow that
4 to be added to the loading case assessment.

5 Where there were detailed container forms
6 added in the manual to summarize and accumulate data,
7 container weights and centers of gravity and then the
8 summary forms modified to include locations for that to
9 be entered in the T&S calcs.

10 MR. KUCHARSKI: Okay. But nothing as far as
11 instructions or changes. I mean we have changes from a
12 row-row to a row-load with higher windage with the
13 stacks on there. Any instructions that I missed in
14 there for that change?

15 MR. SCHILLING: Well, there were no specific
16 changes to instructions for the movement from row-row
17 cargo to container cargo required in the T&S booklet in
18 terms of instructions of how to stow things. The
19 weight accumulation and the weight summary for trim and
20 stability calcs would be the same. You just have to --
21 You can use the new forms for the containers.

22 What did also change instead of the
23 instructions were the required wind heel GM curves. So
24 those were updated for the wind profile for the
25 container stacks. If we look at page 16 of the T&S

1 booklet, previously referenced, those minimum required
2 wind heel GM curves have been updated for the container
3 profile.

4 MR. KUCHARSKI: Okay. Thank you. I guess
5 I'm sort of looking at it from a simplistic ex-master's
6 view. Is there anything in there that talks about the
7 actual wind or voidance or anything like that in the
8 booklet that I missed?

9 MR. STOLZENBERG: This is Eric Stolzenberg.
10 Mike, are you asking specifically for some type of
11 guidance for the master to get from the book regarding
12 wind?

13 MR. KUCHARSKI: Yes, the instructions. I
14 mean there are instructions in there talking about
15 reducing (Inaudible) to help stability. The question I
16 guess about winds, is there anything in there to the
17 user as you gents probably know with the mates on there
18 and the master to look at the booklet? Is there
19 anything that I'm missing in there that talks about the
20 actual wind heel that jumps out and hits them?

21 MR. FRANCE: What the standards are?

22 MR. KUCHARSKI: Okay.

23 MR. FRANCE: Is that what you mean? This is
24 Willa France, Mike.

25 MR. KUCHARSKI: Yes, what the standards are

1 or everything it's based on, 26 feet per second or 50
2 something knots of wind or anything like that?

3 MR. SCHILLING: This is Spencer. I don't
4 believe there's anything in this booklet that was there
5 as either row-row or now with the container profile
6 that would indicate the actual wind force that was
7 assumed for the calculations. These wind heel
8 calculations were done the same for both row-row and
9 container cargo. They use the same Coast Guard applied
10 wind heel requirement. So that hasn't changed.

11 And there was no reference to the actual
12 assumed wind force or other things from the regulation.
13 Usually it's just the indication of the required GM
14 curves.

15 MR. VAN RYNBACH: This is Eugene. I don't
16 think the wind heel is intended -- the Coast Guard wind
17 heel requirement tended to be a maximum wind. It's a
18 standardized wind which causes a heeling moment on the
19 ship and the ship must be able to withstand that
20 according to certain criteria, how much heel it causes
21 and so forth. But it's not an upper limit to what the
22 ship operating condition is. It's just the standard
23 wind force which is used to evaluate the stability of
24 the ship.

25 MR. KUCHARSKI: Right. Sorry, guys. I've

1 been through stability reviews on passenger ships and
2 seen numbers of 90 knots or I've seen numbers of
3 (Inaudible) or whatever and instructions. I guess I
4 may not be able to make the jump over to cargo and see
5 anything similar like that. Okay. Thank you very
6 much.

7 MR. STOLZENBERG: I'll push around for
8 questions on the T&S booklet. That's the topic area at
9 the moment.

10 PARTICIPANT: No.

11 MR. STOLZENBERG: Tom.

12 MR. GRUBER: I don't believe so.

13 MR. STOLZENBERG: This is Eric Stolzenberg,
14 NTSB. One of my questions is on board the vessel there
15 was CargoMax we know from the interviews and there's a
16 T&S booklet. And I know -- I believe I know --
17 CargoMax and T&S booklet are both approved by class.
18 And we know the CargoMax insulation is tested and
19 recertified through validation testing.

20 What I'm curious of is the relationship
21 between CargoMax and T&S booklet as far as their usage
22 aboard the vessel. The ABS review letter indicates and
23 I'll quote it "The approved stability software is not a
24 supplement to the approved T&S booklet." What's the
25 practical difference that that statement exists for in

1 your mind as Herbert Engineering?

2 MR. SCHILLING: Could you read that
3 statement again?

4 MR. STOLZENBERG: "The approved stability
5 software is not substitute for the approved stability
6 information and is used as a supplement to the approved
7 T&S booklet." And I'm asking that from an operator's
8 standpoint.

9 With the NTSB we go and see what people
10 practically use on board the ship. Well, there's a
11 CargoMax for on board there and a T&S booklet. And
12 interviews of the crew seem to indicate they gravitate
13 towards the CargoMax software. So why is there a
14 separation that CargoMax is not to be used in T&S
15 booklet as the more reliable document for lack of a
16 better term?

17 MR. SCHILLING: The preferred document.

18 MR. STOLZENBERG: The preferred document
19 from a Class standpoint. And I guess what I'm asking
20 is is there engineering behind that. Is there more
21 accurate calculation behind it? Why is it that the T&S
22 booklet is the final master document?

23 MR. SCHILLING: This is Spencer. I can't
24 speak for Class in the sense of why they do that. But
25 I do know that statement generally indicates that the

1 T&S booklet is the ultimate authority on stability for
2 the ship. And the point of the approvals for the
3 CargoMax program is to make sure it's matching that and
4 so the crew has comfort in using that to replicate what
5 the T&S booklet is going to give them if they were to
6 redo the calculations that were in the T&S booklet.

7 And in the T&S booklet they would match
8 results from the CargoMax program. But the ultimate
9 authority is the T&S booklet. We believe that's what
10 that statement indicates.

11 MR. STOLZENBERG: No, it is.

12 MR. SCHILLING: And so there are efforts
13 made to make sure that if there are things that affect
14 some of the calculations the way centers of gravity for
15 tanks for instance are calculated in the CargoMax that
16 that information is provided in the T&S booklet that
17 can be reviewed and approved. So then some of those
18 calculations can be done in the T&S booklet and the
19 program isn't doing much more than the trim and
20 stability booklet can do.

21 That's changed a little bit for some ship
22 types in more recent years where the calculations can
23 be done in the loading that cannot be possibly done in
24 the trim and stability booklet with a hand calc form
25 like damage stability for tankers and things like that

1 where there is a direct calculation required instead of
2 requiring GM curves. But I think in this era the idea
3 was that the CargoMax program loading instrument
4 replicated what the T&S booklet was doing.

5 MR. STOLZENBERG: Okay. Thank you.

6 MR. STETTLER: Can I ask a related question
7 to that? And I don't know. Maybe we need to pull up
8 CargoMax later, but the user selects the GM, the
9 limiting required GM, criteria in CargoMax. And you
10 can either select the trim and stability book basically
11 by tier or you can select the option which is an auto
12 wind heel calculation option.

13 MR. SCHILLING: Right.

14 MR. STETTLER: And my recollection from
15 reading the CargoMax users manual and the El Faro --
16 and I forgot the exact title -- specific users manual.
17 There's a document related to its application,
18 specifically the El Faro.

19 MR. SCHILLING: Vessel Information Booklet.

20 MR. STETTLER: Yes. Thank you. Vessel
21 Information Booklet. It talks specifically about --
22 And I should add. There is also a document which is a
23 wind heel calculation manual.

24 MR. SCHILLING: Right.

25 MR. STETTLER: That goes along with that

1 that goes through all that and validates and compares.
2 As I recall, there is a statement in that wind heel
3 book as well as the El Faro book that states that the
4 auto wind heel option is more accurate and less
5 conservative. So rather using -- If you're three high,
6 using three high all across, it will calculate the
7 specific windage area in the calculation. And
8 therefore it is less conservative or more precise is
9 another way to do that.

10 To me that idea seems a little bit in
11 conflict with the statement that Mr. Stolzenberg just
12 read which states or tells the master that he must or
13 should follow the guidance in the trim and stability
14 book and not the loading instrument, CargoMax in this
15 case. It seems that it puts the master at a bit of a
16 conflict there. Could you comment on that?

17 MR. SCHILLING: Right. This is Spencer.
18 The INTACT required GM curves that are in the T&S
19 booklet, I think there are four or five different
20 curves. And each one reflects a different assumed
21 profile of the containers on deck, the height of which
22 the containers are stacked on deck. And with that you
23 can only assume certain even profiles, one tier high
24 everywhere, two tiers high, three tiers. There are
25 some rows that allow four and five high. So an effort

1 is made to use those curves to define a generic profile
2 for the ship.

3 When the ship is actually loaded, the
4 profiles can vary. They can be different. And so the
5 general guidance in the T&S booklet is that you should
6 go with the curve that -- how do I describe this --
7 describes the maximum boundary of the actual containers
8 stowed on deck. So if you're three tiers but you've
9 got one tier that's four high, you have to go to the
10 next curve up.

11 Even though you don't quite meet the
12 definition of the next curve, you would use that. And
13 it's done that way so that you have just a reasonable
14 number of curves to work with in the T&S booklet. And
15 the basic CargoMax program and the curves that you can
16 select are those exact same curves.

17 But there is a feature in CargoMax and I
18 believe it was implemented for the El Faro that because
19 they enter the detailed container stack profile and
20 container locations in the program the program can
21 calculate the actual height of each stack of containers
22 on the ship. So it knows the actual profile.

23 It doesn't have to make an assumption about
24 I have to go to the next curve up. So it's got the
25 information to do the actual calculation of a new

1 required GM curve at that particular profile. That's
2 what's implemented in CargoMax as an option.

3 Because that differs a little bit from
4 what's allowed in those predetermined curves in the T&S
5 booklet, that separate document which compares these
6 curves in the T&S booklet and CargoMax with the direct
7 calculation of the wind heel required GM is produced
8 and submitted with the CargoMax program to get reviewed
9 and approved and get someone to say "Yes. We agree
10 with this approach that this wind heel calculation can
11 be done this way. And we see that the answers are
12 consistent with the T&S booklet documentation."

13 MR. O'MEARA: So that was approved by ABS.

14 MR. STETTLER: Right. This is Jeff
15 Stettler. And I guess the reason I bring it up is
16 because the approval letter -- I can pull up an example
17 here of CargoMax, the approval letter for CargoMax.
18 Here is the approval letter example. It has a
19 statement in there as well.

20 MR. STOLZENBERG: And this is Eric
21 Stolzenberg. For the record, we're looking on screen
22 at the Reference 314297 dated 8 February 2008 from ABS
23 Americas, the approval letter for CargoMax.

24 MR. STETTLER: So I just wanted to clarify
25 or state this. To me, it seems like there's just a bit

1 of a conflict here between the trim and stability book
2 which is more conservative I think in this regard on
3 the required GM in terms of the master, what the master
4 would have to do, versus what the CargoMax program will
5 calculate. So the operator using CargoMax alone would
6 have a less restrictive operating condition than he
7 might get otherwise using the trim and stability book.

8 MR. FRANCE: Could you look down further?
9 Isn't there something in that letter about the wind
10 heel criteria?

11 MR. STETTLER: I don't believe there is.

12 MR. SCHILLING: This is Spencer. I think --
13 (Off record comments)

14 MR. VAN RYNBACH: This is Eugene. I'm not
15 sure that the trim and stability booklet precludes you
16 interpellating between the curves, does it? I don't
17 think it specifies that you -- Essentially what this
18 program does is interpellates between the curves.

19 MR. STETTLER: Right.

20 MR. VAN RYNBACH: So I don't think the
21 stability booklet precludes you from interpellating.

22 MR. STETTLER: The same calculation.

23 MR. VAN RYNBACH: Yes.

24 MR. STETTLER: Right.

25 MR. VAN RYNBACH: So if you have one

1 container over, I think you may be allowed to
2 interpellate. Some books do allow that.

3 MR. STETTLER: The reason I bring this up is
4 there are some people who are saying that you have to
5 follow the trim and stability book. But yet CargoMax -
6 - and I don't know that there's a statement. I thought
7 there was a statement in this letter saying essentially
8 that the trim and stability book needs to be followed.
9 This is simply a supplement.

10 MR. VAN RYNBACH: Yeah.

11 MR. STETTLER: Which I think, Spencer, you
12 had mentioned.

13 MR. VAN RYNBACH: No, I think the question
14 is -- Eugene again -- whether or not you can
15 interpellate.

16 MR. STETTLER: Right.

17 MR. VAN RYNBACH: This is what the CargoMax
18 program does, interpellate between curves. So it may
19 not contradict the trim and stability booklet if you
20 consider the CargoMax an interpellation.

21 MR. STETTLER: So paragraph five "Please be
22 advised that as per references A to B approved
23 stability software is not a substitute for the approved
24 stability information and is used as a supplement to
25 the approved trim and stability book references and

1 facilitates stability calculations."

2 MR. VAN RYNBACH: So that's where it does
3 tie to that automatic wind heel calculation.

4 MR. STETTLER: Right.

5 MR. VAN RYNBACH: That is reference C.

6 MR. STETTLER: Okay.

7 MR. VAN RYNBACH: So it allows it to be done
8 a little bit more accurately because it has an
9 automatic interpellation between the curves.

10 MR. SCHILLING: This is Spencer. And in the
11 sense it's meeting the same stability criteria.

12 MR. STETTLER: Right. I would just like to
13 get that on the record here because there's some
14 swirling discussion about this of whether or not the
15 master can even use this if the trim and stability says
16 one thing. And I think your point about it's
17 interpellating it's actually doing the calculation is
18 an important point. Thank you.

19 MR. STOLZENBERG: And this is Eric
20 Stolzenberg again. And thank you for your opinion on
21 it. Of course, we'll get ABS opinion when we do an
22 interview as well.

23 MR. SCHILLING: Yes.

24 MR. STOLZENBERG: That your interpretation
25 of is valid. I guess part of my interest is and what

1 I've become aware of in this accident is that the
2 software programs for stability, the real time
3 capability of them, is improving rapidly. And the T&S
4 booklet and the software program it's interesting that
5 they both exist at the same time. And what happens in
6 the future is of course another matter. But it's just
7 quite interesting.

8 MR. VAN RYNBACH: A little background on
9 this -- this is Eugene -- some of this is historical
10 reasons. Historically, the stability booklet was a
11 manual calculation. And then computers came in the
12 '80s. But computers weren't considered reliable. So
13 the old paper booklet was still considered primary
14 because a computer was suspect.

15 So some of that terminology is left over
16 from those days. That letter is in the stability --
17 Approvals tend to be based on -- Some of that is from
18 those historical reasons. But as Spencer mentioned,
19 you also have to have one source as primary. This is
20 the governing source.

21 MR. STOLZENBERG: Thank you. We'll just go
22 off the record for a moment because of the lunch plans
23 had been discussed. And we'll come back. Off the
24 record.

25 (Whereupon, a short recess was taken. Tape 1

1 ends.)

2 MR. STOLZENBERG: This is Eric Stolzenberg.
3 It's January 28th at Herbert Engineering, Annapolis.
4 We returned and we're going back on the record to
5 continue the interview of Mr. Eugene van Rynbach and
6 Mr. Spencer Schilling.

7 Gentlemen, I just want to ask some basic
8 questions about stability, intact and damaged. I'll
9 start with this question. What stability criterion did
10 the El Faro have to meet regarding intact and damaged?

11 MR. SCHILLING: This is Spencer. The intact
12 stability requirement was the U.S. Coast Guard wind
13 heel requirement.

14 MR. STOLZENBERG: Okay. And the damage
15 requirement?

16 MR. SCHILLING: The damage requirement I
17 believe that was in place for the El Faro was the
18 probabilistic damage stability requirement. SOLAS
19 essentially.

20 MR. STOLZENBERG: SOLAS. Let me go back to
21 intact. When you said it met wind heel requirement, I
22 understand or I recall there being writing arm
23 requirements in intact. Can you explain the difference
24 to me or why one is limiting and why another isn't? Or
25 are they both not applicable to this vessel?

1 MR. SCHILLING: I believe the only
2 applicable intact stability requirement was the U.S.
3 Coast Guard wind heel requirement and not the writing
4 arm or other weather criteria.

5 MR. STOLZENBERG: In layman's terms, what is
6 the wind heel requirement? What margin of safety does
7 it provide to a vessel? Or how is it -- If you don't
8 understand, that's fine. Please let me know. I'm just
9 trying to understand what it's trying to protect the
10 vessel from or what --

11 MR. SCHILLING: The basic wind heel
12 requirement develops a required GM that a ship has to
13 sail with intact based on the wind profile of the ship,
14 the heeling moment that that creates under an assumed
15 wind velocity. And the GM is established as a
16 requirement to limit the heel that you end up with
17 under that wind force. So it only checks the quasi-
18 dynamics or the wind heeling angle that's imposed by a
19 wind force based on the wind profile.

20 MR. STOLZENBERG: Okay.

21 MR. SCHILLING: And there are other intact
22 stability criteria for different types of ships and
23 other ship categories and other regulations that deal
24 with writing energy as well. So it might be
25 requirements for GZ area limits, maximum GZ values

1 that's the writing arm, the range of positive GZ,
2 things like that.

3 MR. STOLZENBERG: All right. I'll push it
4 around the table regarding intact stability.

5 MR. O'MEARA: This is Dennis. So given what
6 you just said about the wind heel requirement, are
7 there other factors that it takes into account? For
8 instances, if you're talking about a 45 knot wind or a
9 50 knot wind, does the wind heel limit also presume the
10 kind of seas that would be generated by that kind of
11 wind? Or does it presume that there's no ocean
12 activity and you're just talking about how much wind is
13 driving against the side of the ship to heel it over?

14 MR. SCHILLING: This is Spencer. I wasn't
15 there when it was derived. And it doesn't explicitly
16 say what type of sea states are applicable. The
17 criteria itself does not include a definition of the
18 sea state. It's not factored into the calculation.

19 But the criteria applies for ship in general
20 at sea in an unrestricted service. So it's not a
21 criteria that's only applied for ships when they're in
22 calm water.

23 MR. GRUBER: Tom Gruber. Does the position
24 of the down flooding point have any effect on the
25 intact criteria that's applicable?

1 MR. SCHILLING: The intact wind heel
2 requirement includes the angle of heel as a function of
3 the freeboard to the margin line which is a deck edge.
4 And that happens before you would possibly ever get to
5 a down flooding point which would always be above a
6 deck edge. So it does not.

7 MR. GRUBER: Thank you.

8 MR. STETTLER: Nothing specific on intact.

9 MR. STOLZENBERG: Mike on the phone?

10 MR. KUCHARSKI: Nope. Nothing from me.

11 MR. STOLZENBERG: Okay. Earlier I believe
12 it was said and as I understand it from some of the
13 documentation, the vessel is an intact stability
14 weather criteria limited, not damaged stability
15 limited. Is this typical is I guess what I'm asking.
16 I think I've read a few articles and having recently
17 gone to the IMO where they discussed second generation
18 intact stability, that it's atypical to have a vessel
19 that is weather criteria limited versus damage
20 stability limited. Is that typical in your experience
21 for cargo ships like this?

22 MR. SCHILLING: This is Spencer. I think it
23 depends a lot on what type of ship you're looking at.
24 Certainly when you do the probabilistic analysis you do
25 the analysis at some specified GMs.

1 And it's possible that you select those GMs
2 at which you run the damage stability to be the ones
3 that correspond to the intact requirement. So if you
4 meet the intact requirement at those GMs, you also meet
5 the probabilistic damage stability requirement. One is
6 not more governing than the other. As a matter of
7 fact, you could say at that point that maybe the intact
8 requirement is the more severe and that certainly is
9 the case for some ships.

10 So to say that it's unusual that the damage
11 requirement doesn't govern I don't know. That's a
12 matter of judgment.

13 MR. VAN RYNBACH: This is Eugene. Also
14 there is a IMO intact stability code weather criteria
15 which is different than the Coast Guard wind heel
16 criteria. And compared to the -- At least, my
17 experience in the past was compared to the IOM intact
18 stability requirements, the Coast Guard wind heel may
19 be higher.

20 So maybe what you saw at the IOM is
21 discussing the IOM intact stability requirements which
22 may be less than the Coast Guard wind heel
23 requirements. I know many ships in the U.S. Flag
24 switched from Coast Guard to IOM because it was
25 favorable to the ship. The Coast Guard wind heel is

1 not used so much for modern, you know, ships in the
2 last ten years. It's more for older ships.

3 MR. STOLZENBERG: That's interesting. Thank
4 you. I'll kick that one around the table.

5 (Chorus of no's.)

6 Mike on the phone?

7 MR. KUCHARSKI: No thank you.

8 MR. STOLZENBERG: Okay. We'll move on
9 deterministic versus probabilistic damage stability.
10 What is the difference between deterministic and
11 probabilistic stability?

12 MR. SCHILLING: This is Spencer. In a
13 deterministic damage stability assessment, the
14 regulations specify damage cases that have to be
15 assessed and gives you a survival criteria for those
16 damage cases. So it will give you extensive damage.

17 And you have to consider every possible
18 combination of compartments that could be damaged
19 within those damage extent and evaluate the survival
20 characteristics for each of those. And for each of
21 those, the vessel has to survive the damage.

22 For probabilistic, what they do is they
23 apply statistics to the damage extent essentially. And
24 so the smaller damage extent have a higher probability
25 of occurrence that the larger damage extent have a

1 smaller probability of occurrence. And you create a
2 series of damage cases with those varying extent and
3 you apply probabilities to their occurrence.

4 And then you assess the survival in each one
5 of those. And you accumulate the survival probability
6 based on the combination of the statistics for the
7 damage extent and the survival of each one of those
8 cases. And that survival probability has to attain a
9 certain index based on the ship size configuration.

10 MR. STOLZENBERG: In the case of the El Faro
11 as we understand it, it's probabilistic damage
12 stability done in 1993 time period. How is the
13 information from the probabilistic analysis given to
14 the master or the crew on the vessel? How would they
15 use -- I guess what I'm getting at is a deterministic
16 the master would know if he has two compartments
17 flooded. He knows his vessel's okay if it can
18 withstand two compartments flooded.

19 In probabilistic, how does he know that the
20 damage he's sustained matches a case that's been
21 considered by the naval architecture firm that does the
22 probabilistic assessment?

23 MR. SCHILLING: This is Spencer. So even
24 with deterministic, it's not as simple as say if I can
25 survive two compartment damage in all cases because

1 there's still an intact GM associated with that
2 survival and maybe some tank loading restrictions.

3 The way it's communicated in the T&S booklet
4 is it would be communicated through the T&S booklet to
5 the master. And in the T&S booklet would be some
6 statement about in order to survive damage stability
7 you have to meet these required GM curves at these
8 drafts and I'm thinking deterministic basis now,
9 deterministic rule. And also at these drafts you have
10 to have so much weight or so much of the tank filled
11 because the level of fill in the tank will affect the
12 damage survivability capability.

13 It can be if the ship is simple, maybe you
14 don't need loading restrictions and you just have
15 required GM curves. But if the ship is complex, then
16 you might have to have loading restrictions, GM curves
17 at various drafts. And that would have to be checked
18 at every intact departure.

19 I'm at this intact departure. I only have
20 these tanks filled to this level. I've got to go into
21 my damage stability requirement list and see if I'm at
22 this draft and with these tanks. What required GM do I
23 have and do I meet that at departure and throughout the
24 voyage?

25 Then they would know that they satisfied the

1 damage stability requirements. That would be the
2 method of checking.

3 With probabilistic approach, the
4 calculations are done at two or three predefined
5 drafts. And you evaluate it for specific GMs. So
6 typically you'll do that evaluation at some GMs, run
7 the calculation. If you attain the index, then those
8 GMs become your guidance on what your intact case has
9 to be. And you cannot go below those GMs. So any GM
10 above that works and any GM below that doesn't work.

11 And you can generate a curve from those two
12 or three values. But it's very unusual to have any
13 kind of loading ships to do that. But it's
14 communicated through the GM, essentially intact GM.

15 MR. STOLZENBERG: And probabilistic.

16 MR. SCHILLING: In both really.

17 MR. STOLZENBERG: Both.

18 MR. SCHILLING: So rather than just saying
19 you're a two compartment ship or one because that's GM
20 related -- the probability is it's GM related -- that's
21 not going to be enough to tell you if you're good or
22 not.

23 MR. STOLZENBERG: Understood. I'll go
24 around the table.

25 MR. GRUBER: So you're saying for the

1 deterministic if you meet the GM curve and the loading
2 restrictions, the ship will survive the damage to the
3 extent defined in the regulation.

4 MR. SCHILLING: This is Spencer. That's
5 correct.

6 MR. GRUBER: Okay. Now for probabilistic,
7 does the same hold true? Will it survive all the
8 possible cases of damage and still meet the criteria?
9 Does meeting the criteria mean all cases of damage will
10 comply?

11 MR. SCHILLING: This is Spencer. No, it's
12 not the case. So there are certain damage. They could
13 be two compartment, three compartment, four compartment
14 that will not survive. No survive meaning they don't
15 meet the survival criteria. It doesn't necessarily
16 sink, but it doesn't meet the GZ area requirements or
17 the (Inaudible) requirements, things like that. That
18 particular damage case can fail the criteria, but
19 you're adding up small components of survival from all
20 the different damage cases.

21 And you have to get to a certain attained
22 index. So it's the preponderance of damage cases have
23 to survive enough to add up to an achieved index that
24 equals the required index.

25 MR. GRUBER: Tom Gruber again. But there

1 are cases that will fail to meet the criteria or the
2 vessel could possibly sink in those conditions. Yet the
3 vessel will still overall comply with the criteria.

4 MR. SCHILLING: This is Spencer. That's
5 correct.

6 MR. GRUBER: Thank you.

7 MR. STOLZENBERG: This is Eric Stolzenberg
8 to follow up. But what probabilistic is attempting to
9 do is make those low probability events that would
10 result in a vessel sinking, but nonetheless still allow
11 it to pass probabilistic damage to regulations?

12 MR. SCHILLING: This is Spencer. Yes. I
13 think the golden rule was to try to achieve a
14 consistent safety level for the ship. When you define
15 fixed deterministic case and fixed extent -- so you
16 have a two compartment ship -- the probability of
17 damage of just two compartments or maybe over to that
18 third compartment is not much different. And yet you
19 may not survive three, but you survive two.

20 Just by adjusting your bulkheads you can
21 survive the deterministic, but you may have an increase
22 in safety level too much. You can achieve varying
23 levels of safety margin in that case.

24 So I think the probabilistic rules were a
25 way to try to achieve more consistent safety level as

1 ship designs change and different ship types were
2 developed.

3 MR. STOLZENBERG: Before I pass it on to
4 Jeff, I mean this is an opinion question over the
5 course of your career. Do you think they have achieved
6 safer levels of damage stability?

7 MR. SCHILLING: Well, I think certainly in a
8 sense that we had started down the road of
9 probabilistic in the late '70s simply because there
10 were no dry cargo ship damage stability regulations at
11 all. There was nothing in place. The passenger ships
12 had some, but there was nothing for -- And tankers went
13 through MARPOL (phonetic).

14 But dry cargo ships had no requirements
15 whatsoever. And that was the case when these ships
16 were initially built. There were no damage stability
17 regulations at all.

18 And then when they started developing the
19 damage stability regs for cargo ships and they started
20 taking them to IMO and doing those kinds of things
21 probabilistic seemed like the best way to go to achieve
22 that. They had the model of the passenger ship rules
23 already. And so they tried to apply the same theory
24 and technology and approach to cargo ship damage
25 stability.

1 MR. STOLZENBERG: Okay. So in fact before
2 probabilistic applied to this vessel, it would have no
3 damage stability requirements to your knowledge.

4 MR. SCHILLING: I don't think there were any
5 damage stability.

6 MR. STOLZENBERG: Okay.

7 MR. GRUBER: Different subject or do you
8 want to stay on this subject?

9 MR. STOLZENBERG: I'd ask Mike on the phone
10 if he has anything along the lines of conveying damage
11 stability to master.

12 MR. KUCHARSKI: No. No thank you.

13 MR. STOLZENBERG: I'll let you take the next
14 subject, Jeff.

15 MR. STETTLER: Okay. Change gears a little
16 bit. I just wanted to ask a couple of questions about
17 your development of some of those reference documents.
18 And we'll start with the cargo securing manual rev zero
19 which dated December 2005 which I believe is the last
20 one submitted. So I guess the one document.

21 What did you use as the basis for that
22 document? Did you develop that from scratch for the El
23 Faro?

24 MR. SCHILLING: Those documents -- this is
25 Spencer -- the cargo securing manuals for the El Faro

1 was based on the documents formatted for the El Yunque
2 and the El Morro which were products of Manson
3 Navigation. It was their standard cargo securing
4 manual format. And it's the one they still use.

5 MR. STETTLER: Okay. So you use those as
6 your basis. What other relevant references for cargo
7 securing manuals in general? Are there guiding
8 requirements for those coming from the Cargo Bureau?
9 What determines what's going to be included in a cargo
10 securing manual? And what kind of calculations get
11 done for example?

12 MR. SCHILLING: There are IMO guidelines for
13 container securing and cargo securing.

14 MR. STETTLER: Okay.

15 MR. SCHILLING: There are also class rules
16 and/or guidelines for container stowage, cargo stowage
17 and container securing.

18 ABS has guidelines for container securing.
19 I don't believe they're required to be used. In other
20 words, those would define the lashing limits and the
21 stack weights and things like that for containers and
22 container securing system.

23 ABS doesn't require that you use their
24 lashing guidelines in formulations. Matson had -- We
25 shouldn't talk Matson, but SeaStar and TOTE I believe

1 were using the ABS guidelines for things like container
2 securing.

3 MR. STETTLER: Okay. Very good. Thank you.

4 MR. VAN RYNBACH: This is Eugene. Just to
5 clarify, there is an IMO document describing what
6 should be in a cargo securing manual and that also lays
7 out a sample format for a cargo securing manual for the
8 different sections. So most cargo securing manuals are
9 constructed according to that IMO document.

10 MR. STETTLER: This is Jeff Stettler. Do
11 you happen to know the name of that?

12 MR. VAN RYNBACH: It's most likely listed in
13 the cargo securing manual as a reference.

14 MR. STETTLER: Okay. I think you're right.
15 I took a glance through it, but I didn't read it in
16 detail. Thank you.

17 Can we go onto some other documents or do
18 you want to talk specifically about the cargo securing
19 manual?

20 MR. STOLZENBERG: I'd just ask if anyone
21 else has anything on the cargo securing manual.

22 (No verbal response)

23 Mike on the phone, cargo securing manual?

24 MR. KUCHARSKI: Yes, I have a few on the
25 cargo securing manual. Thank you.

1 Do we have a copy of it out there or no?

2 PARTICIPANT: I can pull it up on our
3 computer here, Mike, if you want to refer to
4 something.

5 MR. VAN RYNBACH: This is Eugene. We do not
6 have a printed copy here. It's like 160 pages.

7 MR. KUCHARSKI: Yeah. Whatever you want to
8 do. I have specific questions on the cargo securing
9 manual.

10 MR. VAN RYNBACH: Okay. There's an
11 electronic copy now available on a video screen.

12 PARTICIPANT: We brought it up, Mike. We
13 have the SeaStar Line SS El Faro cargo securing manual
14 approved by ABS 20 January 2006.

15 MR. KUCHARSKI: Perfect. Specifically on
16 page 18 -- First of all, if I look through the manual I
17 don't see anything that talks about testing of any of
18 the securing systems as you call them or securing
19 equipment. On page 18, there's a table which talks
20 about tests. So what tests were envisioned under that
21 table?

22 MR. SCHILLING: Is there a procedure number
23 in the upper right-hand corner of the page?

24 MR. KUCHARSKI: Let me see. It's page 18.

25 PARTICIPANT: Oh, it's sheet number 18 in

1 the PDF.

2 MR. KUCHARSKI: Yeah, in the PDF.

3 MR. SCHILLING: Okay. I'm sorry. You're
4 right. We're right there then.

5 MR. KUCHARSKI: It's numbered E03435, page
6 six of six. It has test result on there. So what
7 tests do they envision?

8 MR. SCHILLING: This is for inspection of
9 the actual portable securing devices like twist locks,
10 turn buckles, lashing rods. It's a matter of looking
11 at them to see if they're operating correctly. There
12 are some instructions in there I believe about how to
13 operate a twist lock and whether the mechanism is
14 working or the turn buckle. And it's just a visual
15 inspection or test that that operates correctly.

16 MR. FRANCE: To be completed by whom?

17 MR. SCHILLING: By the ship's crew. For the
18 actual securing equipment like the same portable
19 lashing gear, they're supplied with strength test
20 certificates provided by the manufacturer. So the safe
21 working load, the mean braking (Phonetic) are indicated
22 on certificates, reporting on tests done in the class
23 rules certifying the strength of the equipment.

24 MR. KUCHARSKI: So that certification was
25 when it was as-built or when it was installed, correct?

1 MR. SCHILLING: Well, whenever they purchase
2 new container securing equipment they should be getting
3 the certificates with it. And those certificates
4 should either be filed in their system with Class or
5 appended to the manual.

6 MR. KUCHARSKI: I guess I'm confused because
7 you keep going to container securing. But if you go
8 the page right before it talks about inspection
9 requirements for structure, fixed securing devices.
10 Are the buttons and D-rings not considered fixed
11 securing devices?

12 MR. SCHILLING: The buttons on the deck for
13 the rollout boxes and the D-rings and things those are
14 fixed securing devices. They don't go through factory
15 strength tests. So this checking and logging here is
16 for again a visual inspection of those on board.

17 MR. KUCHARSKI: Okay. So when you say test
18 result, I guess I look for some kind of a pull test,
19 some kind of strain gauge, something on it there
20 besides a subjective test. So more objective. The
21 test results you're really talking about a visual
22 inspection.

23 MR. SCHILLING: Yes, and if the mechanism is
24 working. In the case of a rollout box, it might be if
25 they see some damage or some anomaly in the button that

1 they place the rollout box in and see if it can be
2 secured and the locking mechanism works.

3 MR. KUCHARSKI: Okay.

4 MR. SCHILLING: It's not a pull test for a
5 strength requirement.

6 MR. KUCHARSKI: On page 27 of the manual,
7 you call this a container ship. And you say -- I hate
8 to paraphrase it -- it predominantly carries
9 containers. Can you tell then is everything else
10 nonstandard cargo under the CSS? What's standard cargo
11 for the ship?

12 MR. SCHILLING: Well, standard cargo for the
13 ship would be both containers and the row-row trailer
14 cargo, the normal trailer cargo that they have.

15 MR. KUCHARSKI: It would include -- I'm
16 sorry -- the trailer row-row cargo. Is that correct?

17 MR. SCHILLING: That's part of their
18 standard cargo. That's correct. The trailer cargo
19 that they have with the roll lock buttons that they
20 load with the yard tractors.

21 MR. KUCHARSKI: Okay. So on page 28 where
22 it talks about Annex four (phonetic) special wheel-
23 based rolling cargo, those wouldn't be included in that
24 trailers.

25 MR. SCHILLING: I'm sorry. Where are you

1 looking?

2 MR. KUCHARSKI: It's on page 28 of the
3 manual where it talks about stowage and securing the
4 non standardized cargo. I'm just trying to get my arms
5 around what's standard and non standard on the ship.
6 It talks about portable tanks, tank containers. And
7 then a little bit further down it says Annex four at
8 the bottom of that page, section 5.1 of General where
9 it talks about special wheel-based loading cargoes.

10 MR. VAN RYNBACH: Could we look at the index
11 at the first page? There may be a separate section --
12 this is Eugene -- for the roll-on/roll-off cargo.

13 MR. KUCHARSKI: I can give you the procedure
14 number if you'd like.

15 MR. VAN RYNBACH: No, no. I'm just looking
16 at the different. So this ship had two types of cargo
17 primarily. One was the container cargo. So the
18 container section of the manual was written for the
19 parts that were containers.

20 And then there is a separate section. It
21 appears to be -- We're looking at the index on the
22 first page. It says "Stowage and Securing of Row-Row
23 Cargo." So there's a separate section regarding the
24 below deck row-row cargo.

25 And I think maybe the section we were

1 looking at before was primarily focused on the
2 container securing which is the above deck cargo. So
3 the ship had segregation of two types of cargo.

4 MR. SCHILLING: And the non standard cargo
5 would be project cargo that's truly unique. It may
6 only be carrying one piece of it. It could be
7 construction equipment. It could be some other types
8 of heavy lift equipment. It could be military rolling
9 stock. It could be those types of things. Whereas the
10 standard row-row cargo are the trailers, the standard
11 40 foot trailers, such that they drive on and park.

12 MR. KUCHARSKI: Great. And in the manual I
13 noticed that inspection of the portable securing
14 devices -- portable I say -- includes wastage. I guess
15 you look at wastage by eyeball.

16 MR. SCHILLING: This is Spencer. Yes, it's
17 a visual inspection. There's no gauging done of the
18 equipment.

19 MR. KUCHARSKI: Okay. And on the fixed, I
20 didn't see any treatment of wastage. Is that not
21 required by the CSS or is that any oversight? Any idea
22 on that?

23 MR. SCHILLING: There are no guidelines on
24 the amount that specifically address the wastage on the
25 fittings. I think in terms of outfit like you would

1 have for whole structure.

2 MR. KUCHARSKI: Okay. You said it would be
3 under the whole structure and not relating to the cargo
4 securing or fixed, what they term under the CSS, or in
5 your manual as the fixed part of the cargo securing
6 system.

7 MR. SCHILLING: Right. There are no
8 specific guidelines on the amount of corrosion that's
9 allowable for the fixed securing devices.

10 MR. KUCHARSKI: Great. Again, I think -- I
11 don't know where you want to treat this if this is
12 going to be separate. I know the CargoMax has figures
13 for the containers it does it looks like. But I guess
14 the question is the verification of the figures against
15 the cargo securing manual. Is that better held for
16 discussion on CargoMax? I know we treat it under the
17 trim and stability book and CargoMax and the test cases
18 and everything else. Is Eric or --

19 MR. STOLZENBERG: I would say if this
20 question is related to the line of topic we're on right
21 here let's cover it right now.

22 MR. KUCHARSKI: I'll mention it and see if
23 we're comfortable then. I know what you talked about
24 earlier on. I think it was Spencer was talking about
25 the surveyor goes on with the test cases and compares

1 the loading instrument against the trim and stability
2 manual or trim and stability book and verifies that
3 they're correct or within tolerances.

4 Does that also fall under the checking or
5 comparing the CargoMax to the cargo securing manual?
6 Is that captured somehow there?

7 MR. SCHILLING: This is Spencer. I can't
8 speak to how exactly the lashing limits for the
9 containers which are calculated in CargoMax are
10 verified against the cargo securing manual limits. So
11 you would have to ask that question of Mike Newton.

12 In general, the lashing limits or the stack
13 weights shown for containers in this cargo securing
14 manual are samples. It can't by definition really or
15 practicality cover all the possible options of
16 container stack weights. So there are some samples
17 given in the manual that give the crew a general sense
18 for what those limits are. But it's very hard to
19 represent the actual stack weight limits for any given
20 either lashing configuration or any stack weight
21 distribution.

22 MR. VAN RYNBACH: This is Eugene. I just
23 want to clarify. There are two limitations applied to
24 container stacks. One is the actual physical weight of
25 how much the containers weigh against the strength of

1 the deck to support that weight. And two is how the
2 different weights of the containers at different tiers
3 compare to the strength of the container to support
4 those weights from the ship's motions.

5 You have to be a little careful. There is
6 stack weight limitations and tier weight limitations.
7 Stack weight is the strength of the deck to support
8 that weight. And then tier weights is whether or not
9 you have heavy containers on the top or not,
10 restrictions on the weight of the container higher up
11 in the tiers.

12 MR. STOLZENBERG: And this is Eric
13 Stolzenberg. I'm just going to inject for a moment,
14 Mike, and then hand it back. Just to follow up on what
15 Eugene said, I just want to clarify. So for the
16 weights in the individual containers, if the greatest
17 weight is at the top of a stack, say on the container,
18 that raises the center of gravity of the load and
19 therefore the vessel. And it has an adverse effect on
20 stability. Or why is it that you can't have the height
21 high up? Or does it snap the stay bars or the lower
22 fittings that connect the bottom of the stack to the
23 deck due to accelerations?

24 MR. VAN RYNBACH: This is Eugene. The
25 latter is the reason. One particular stack will not

1 affect the stability of the ship. But it could
2 overwhelm the strength of the container at the bottom,
3 its fittings and the lashing bars.

4 MR. STOLZENBERG: Thank you.

5 MR. SCHILLING: So maybe I'll need to
6 clarify. This is Spencer. But the lashing limits and
7 the stack weight limits, things given in the cargo
8 securing manual, are there specifically to establish
9 whether the stack is lashed adequately. So it's
10 focused on the strength of the lashing system, the
11 securing system, that's both the fixed fittings, twist
12 locks, and the lashing rods. And that as Eugene has
13 said is very much a function of the weight distribution
14 in the stack as well as the total weight of the stack.

15 Stability limits are covered by the loading
16 instrument through the methods in the T&S booklet where
17 just the height, weight and CG are covered and added up
18 for the total ship. You come up with the total ship
19 VCG. And the stability is taken separately.

20 The cargo securing manual is strictly
21 talking about the securing aspects of a given stack or
22 a trailer on the ship to make sure it stays there.

23 MR. STOLZENBERG: Understood. And I'll hand
24 it back to you, Mike.

25 MR. KUCHARSKI: Okay. Great. Thank you.

1 Based on the accelerations. Got it. Are there data
2 submissions that you submit, data along with the
3 approval, of the cargo securing manual?

4 MR. SCHILLING: This is Spencer. Yeah, if
5 there's enough data in the cargo securing manual to
6 calculate the accelerations and the allowable stack
7 weights and the lashing limits. And that would include
8 the strength of the lashing gear and information on the
9 assumed strength of the containers and then the sample
10 conditions that the weight distribution in the stacks.
11 And that's something that Class can then run in their
12 own program to confirm that those weight distributions
13 do meet the strength requirements.

14 MR. KUCHARSKI: Okay. Great. So there's no
15 longer supplemental data that's sent along with the
16 manual itself.

17 MR. SCHILLING: This is Spencer. I don't
18 believe so. No. Check this particular manual, but in
19 most cases the manual itself should provide enough
20 information to verify the calculations.

21 MR. KUCHARSKI: Okay. Great. Thank you.
22 That's all I have, Eric.

23 MR. STOLZENBERG: Okay. Thanks. And I'll
24 go to Jeff again to lead off another topic.

25 MR. STETTLER: Okay. General arrangement

1 drawing. I know we talked briefly about it. There
2 were a couple of issues I just wanted to try to tie the
3 loop on. What did you use as the basis? You made a
4 original general arrangement drawing, rev zero. What
5 did you use as the basis for that general arrangement
6 drawing?

7 MR. VAN RYNBACH: This is Eugene. I
8 probably have more knowledge on that. We used the
9 Northern Lights general arrangement drawing as a basis
10 for the El Faro. The Northern Lights being the
11 precursor ship, the roll-on/roll-off ship.

12 MR. STETTLER: So that being from what year?
13 Like the 1990s?

14 MR. VAN RYNBACH: 1993.

15 (Simultaneous speaking)

16 And I think the format is similar as to the
17 -- We either copied the PDF or we had the auto cad -- I
18 don't recall -- of the Northern Lights.

19 MR. STETTLER: But you create the -- You
20 have an auto cad now, drawing now. So you created that
21 either by tracing very carefully or some way of
22 creating your auto cad drawing from the old which was
23 probably a fiche drawing.

24 MR. VAN RYNBACH: Yes.

25 MR. SCHILLING: Or we had paper drawings.

1 MR. VAN RYNBACH: Or we had a scanned in
2 copy. Or we had an auto cad. I'm not sure.

3 MR. STETTLER: Okay. Did you also during
4 that same time frame -- I think the answer to this is
5 no -- do anything or make any changes to either the El
6 Yunque or the El Morro? I think you answered that you
7 didn't have any responsibility for the El Yunque and
8 the El Morro at that time.

9 MR. VAN RYNBACH: That's correct. We did
10 not.

11 MR. STETTLER: So you did make any similar -
12 - You didn't create a general arrangement for either of
13 those two at that same time.

14 MR. VAN RYNBACH: No.

15 MR. SCHILLING: What same time?

16 MR. STETTLER: The 2005 time frame, 2006.
17 So this was the first general arrangement drawing for
18 the TOTE vessels that you completed. Is that correct?

19 MR. VAN RYNBACH: Yes.

20 MR. STETTLER: I'm looking at the El Faro.

21 MR. SCHILLING: El Faro, yes.

22 MR. STETTLER: Thank you. Okay. We touched
23 on this, but I wanted to -- We talked a little bit
24 about validation. And how was the general arrangement
25 drawing validated and compared to the actual shipboard

1 configuration of the El Faro or the Northern Lights at
2 the time? Was there any effort by anybody as far as
3 you know to validate that general arrangement drawing?

4 MR. VAN RYNBACH: The draftsman went to
5 visit the ship in 2006.

6 MR. STETTLER: Does Herbert Engineering have
7 -- Is there a process, a procedure or process, for how
8 that gets done? In other words, is there a checklist
9 or does he keep a log of what he did when he was doing
10 his ship check?

11 MR. SCHILLING: This is Spencer. For
12 clarification, I think the primary purpose of the ship
13 check was to verify areas that were being modified, not
14 the general arrangement. All the other aspects of
15 that, we didn't go through and verify everything that
16 was given to us on the GA.

17 MR. STETTLER: Thank you for that. That was
18 an important clarification. So I'm assuming then that
19 Herbert Engineering or the engineer or the draftsman
20 did not go and verify tank locations for example or
21 doing anything or going into the engine room and
22 verifying engine room tanks, anything like that.

23 MR. SCHILLING: No. We had the drawings,
24 the general arrangement and the T&S booklet and things
25 that outlined all that and we assumed that all that was

1 good.

2 MR. STETTLER: Based on your experience as a
3 full service naval architecture firm, if you were to
4 start from scratch and build a vessel or be responsible
5 for a major modification to a vessel, is there a point
6 where a general arrangement drawing should be validated
7 in your view?

8 MR. FRANCE: In its entirety.

9 MR. STETTLER: Yes. So here we have this
10 general arrangement drawing. Is there some point in
11 the life of the vessel where that general arrangement
12 drawing should have been validated for bulkhead
13 location, tank boundaries and the like?

14 MR. SCHILLING: This is Spencer. Our
15 experience is that that's not usually something that is
16 done where areas away from any of the modifications are
17 actually revalidated and checked. I mean it might be
18 common to do an inclining on a basis to verify that
19 because that's something we can change over time. But
20 things that don't change through time like tank
21 boundaries and things like that you pretty much assume
22 that it's as built.

23 MR. STETTLER: Ultimately going back, you're
24 counting on going back to the builders basically and
25 the validity of their original general arrangement

1 drawing through the life of the vessel that that
2 general arrangement has stayed. The reason I ask is I
3 have seen some of the older general arrangement
4 drawings and there seem to be some differences in terms
5 of where certain tanks are for example and where those
6 have appeared to have changed over the life of the
7 vessel and it's not clear why or to the extent that
8 they happened.

9 MR. SCHILLING: Right. So again normally if
10 you're doing something, doing work with a ship, you
11 might check the things that are impacted by what you're
12 doing. Or if you're doing a calculation or an
13 analysis, you check the things related to that.

14 But you wouldn't necessarily go back and
15 revalidate things that have nothing to do with the
16 changes you're doing. I think it's a fair assumption
17 to make that if the ship's operating in class and
18 Flag's happy with everything on the arrangement drawing
19 that they're working with, the capacity plan, the T&S
20 booklet, are properly representing where the tanks and
21 compartments and other things are. And that was the
22 basis of our going forward.

23 MR. VAN RYNBACH: This is Eugene. Also that
24 modification was just primarily with deck stowage. We
25 didn't get involved. There was no change in any of the

1 boundaries inside the ship or engine room or anything
2 like that. So it was a limited modification.

3 MR. STETTLER: Right. And I do understand
4 that. I'm trying to think back because there were at
5 least two tanks that I know of that are in different
6 locations now apparently than they were in the early
7 1980s. And it's not clear.

8 MR. SCHILLING: On this particular ship?

9 MR. STETTLER: Yes, according to some of the
10 general arrangement drawings. It's not clear why or
11 whether or not -- So it may have been during the
12 lengthening there were changes made.

13 MR. SCHILLING: During the lengthening they
14 picked it up on the GA.

15 MR. STETTLER: So we would have to go back
16 and look. But just as a matter of course, you don't --
17 Herbert Engineering does not do a sight survey and
18 validate all that other than the work you're doing.

19 MR. SCHILLING: No.

20 MR. STETTLER: Okay.

21 MR. SCHILLING: The ship was sailing with
22 the GA and T&S booklet that it had which represented
23 the tanks at the time.

24 MR. STETTLER: Okay. So there's an
25 underlying assumption on that. Okay.

1 MR. STOLZENBERG: Can I follow up on that
2 same line?

3 MR. STETTLER: Absolutely.

4 MR. STOLZENBERG: I think earlier you
5 mentioned a gentleman that worked in other firms. Is
6 that typical for naval arch firm? Would other firms do
7 a full validation of a GA if they were modifying the
8 chain locker and producing a GA from it? What I'm
9 asking is what Herbert does is that typical for the
10 industry in your opinion?

11 MR. SCHILLING: Spencer. In my opinion,
12 it's not typical to do that if you're making a
13 modification especially to a very limited part of the
14 ship to validate the entire general arrangement.

15 MR. STOLZENBERG: Okay. Thank you.

16 MR. SCHILLING: I mean normally a lot of
17 times in this kind of case you would have taken the
18 paper drawing and just revised the deck area that we
19 were changing and issue a revision. And that's
20 essentially all that was done here. We just redrew it
21 because it was easier to show the change.

22 MR. STOLZENBERG: Thank you.

23 MR. STETTLER: And then I guess related
24 questions to the capacity plan which you produced also.
25 What's the basis of that? You used I assume the

1 general arrangement drawing. What's the relationship
2 between that capacity plan which shows loading,
3 container loading, stowage locations and row-row
4 locations? Is there a relationship between that
5 capacity plan and the trim and stability book? Are
6 they meant -- Should they reflect the same loading
7 configurations?

8 MR. SCHILLING: This is Spencer. The
9 drawings should typically reflect all the same
10 configurations whether you're looking at the capacity
11 plan or the T&S booklet or the GA.

12 On the capacity plan, you have additional
13 information on tankages and things like that. And the
14 capacity plan is submitted in support of the T&S
15 booklet. The T&S booklet should show the actual final
16 stowage arrangement.

17 MR. STETTLER: So they should be consistent.
18 All right. Thank you. I think that's all I have on
19 that topic.

20 MR. STOLZENBERG: I'll push that around the
21 table on this topic.

22 (No verbal response)

23 Anything on the phone, Mike?

24 MR. KUCHARSKI: No thank you.

25 MR. STOLZENBERG: Before I go back to Jeff

1 to lead off the topic, one of the questions that's on
2 my mind is does Herbert do any foreign flag stability
3 work like T&S booklets and loading instruments for
4 nondomestic vessels?

5 MR. SCHILLING: This is Spencer. Yes, we
6 do.

7 MR. STOLZENBERG: Are you familiar with
8 those products?

9 MR. SCHILLING: Well, I speak for the
10 loading instrument side. Certainly the products are
11 sold worldwide.

12 MR. STOLZENBERG: Okay.

13 MR. SCHILLING: Distributed worldwide on
14 ships of all flags and class societies really.

15 MR. STOLZENBERG: One of the things I'm
16 trying to get a handle on is this ship is domestic.
17 And some of the discussion is the difference between
18 domestic rules and foreign rules. In your opinion, are
19 the domestic rules and the products you produce for the
20 domestic market equivalent to the foreign requirements
21 and the foreign products you produce? Are they less
22 stringent? Are they more stringent?

23 I'm struggling with how to phrase this
24 exactly. But I'm looking for a comparison between
25 what's produced in stability and loading instruments

1 for a foreign flag vessel under international rules and
2 a domestic vessel. Are they comparative levels of
3 safety? Comparative levels of products? It's an
4 opinion question.

5 MR. SCHILLING: This is Spencer. Let's just
6 dealing with the product being a loading instrument
7 first. It's the same product that goes out whether
8 it's domestic or foreign. In terms of level of safety,
9 I think you're referring more to the stability
10 requirements, the strength requirements, that would be
11 incorporated in the loading manual and the T&S booklet.

12 So those are directed by class and by flag
13 administration. So as to the extent that there are
14 differences in U.S. flag requirements for stability and
15 strength than the foreign flag, then that might be a
16 difference in the level of safety.

17 But in terms of what the loading instrument
18 is really doing, it itself is not a difference. The
19 product is the same regardless of where it goes.
20 Different features are incorporated in the program for
21 different owners, but the fundamental program is the
22 same.

23 On the engineering side --

24 MR. VAN RYNBACH: I think currently the U.S.
25 Coast Guard flag state regulations for U.S. flag

1 stability are concurred with international.

2 MR. STOLZENBERG: Were they always?

3 MR. VAN RYNBACH: No. The Coast Guard
4 started accepting international probably late '80s,
5 early '90sin lieu of the wind heel. The wind heel
6 criteria Coast Guard was a traditional Coast Guard. It
7 goes probably back World War II or previously. And
8 this was mandatory for U.S. flag ships.

9 But in the late '80s, early '90s they
10 allowed equivalent calculation under international IMO
11 intact stability codes. And since then they've
12 gravitated more and more towards most ships, even U.S.
13 flag, are now all done under the international
14 regulations.

15 I don't think any new ship uses the U.S.
16 Coast Guard wind heel. I'm not sure, but none that I'm
17 familiar with.

18 MR. STOLZENBERG: Okay. Thank you. I push
19 that around the table, that line of thinking or topic.

20 (No verbal response)

21 Mike on the phone?

22 MR. KUCHARSKI: No thank you.

23 MR. STOLZENBERG: Okay.

24 MR. STETTLER: I'd like to shift gears if I
25 could and talk a little bit about the actual

1 calculations that were done to support two documents.
2 One is the inclining experiment that was done on the El
3 Faro in 2005 or 2006. I don't remember the exact date.
4 And the trim and stability book, the calculations to
5 support the development of that book dated 2007.

6 So how can you utilize computer modeling
7 analysis to complete those calculations to support
8 those two documents? What software package was used to
9 calculate the light ship condition from the inclining
10 and for the necessary intact data for the trim and
11 stability book?

12 MR. VAN RYNBACH: This is Eugene. A program
13 called HECINCLINE, I-N-C-L-I-N-E, was used for
14 analyzing the incline test data. And then it generates
15 the light ship from the input data including the
16 offsets, the hydrostatics of the vessel.

17 MR. STETTLER: Is that a modification of
18 HECSALV?

19 MR. VAN RYNBACH: Yes.

20 MR. STETTLER: What's the relationship?

21 MR. VAN RYNBACH: Well no.

22 MR. SCHILLING: Let me clarify. This is
23 Spencer. HECINCLINE program was written for the U.S.
24 Coast Guard for doing their own inclining on their own
25 boats. And it also was released commercially, although

1 our primary user is the Coast Guard and anybody that
2 inclines Coast Guard vessels.

3 MR. STETTLER: Okay.

4 MR. SCHILLING: The HEC continues to use it
5 internally and has maintained it. It's a separate
6 program from HECSALV. It's not -- And it doesn't do --
7 I think the actual hydrostatic calculations has been
8 incorporated as an option using the HECSALV engine.
9 But otherwise it doesn't share any code with HECSALV.

10 And primarily again for the incline program,
11 it's a tabulation of weights (Inaudible) So it's just
12 a dead weight summary spreadsheet type form. And it
13 allows you to enter the weight movements and the
14 pendulum readings in order to calculate the tangent of
15 the movement curve and you get the --

16 MR. STETTLER: So it does the plot.

17 MR. SCHILLING: Right. And the draft and
18 freeboarding interpellations.

19 MR. STETTLER: The calculation engine, is it
20 using the same HEC model that the lines and stations
21 and offsets in the same model?

22 MR. SCHILLING: It has the capability to use
23 it. It can also take manual entry of hydrostatics to
24 determine in some other way. Maybe from the
25 hydrostatic table, it might just use --

1 MR. STETTLER: Do you know which of those
2 was done on the El Faro?

3 MR. SCHILLING: I don't recollect.

4 MR. STETTLER: So similar question for the
5 trim and stability book, the calculations that were
6 done to support the trim and stability book. Spencer,
7 I think you had mentioned in your email to me that the
8 GM curves are actually a fairly straightforward
9 calculation based on the wind area. And you actually
10 have a spreadsheet that does that calculation.
11 Otherwise, what software was used for most of that?

12 MR. SCHILLING: Again, to get to the
13 required GM curves, that was the spreadsheet formula
14 that we used.

15 MR. VAN RYNBACH: This is Eugene. The
16 actual calculations are in that document submitted to
17 ABS. The wind heel calculations which you referenced
18 it earlier.

19 MR. STETTLER: For the CargoMax.

20 MR. VAN RYNBACH: For the CargoMax.

21 MR. STETTLER: Okay.

22 MR. VAN RYNBACH: It's basically that.
23 That's the calculation.

24 MR. STETTLER: In that document, okay. So
25 that was done in CargoMax as opposed to --

1 MR. VAN RYNBACH: Well, it was done in
2 Excel, but that document used in support of CargoMax
3 basically represents the same values.

4 MR. STETTLER: So in the case of CargoMax
5 then, the model that is the basis for the hydrostatic
6 cables and the tank capacities and all that in
7 CargoMax, yes.

8 MR. SCHILLING: I'm sorry to interrupt.
9 This is Spencer again. Just to clarify it, part of the
10 question related to the intact GM curve which was a
11 spreadsheet calculation.

12 MR. STETTLER: Right.

13 MR. SCHILLING: To calculate that. As I
14 explained earlier, it's a simple function of the wind
15 area moment and the heel angle to get you to a certain
16 or a heel angle, right. So that's a spreadsheet
17 calculation.

18 We did that calculation to check the El
19 Faro. We compared that to the other sister ships and
20 they're almost identical. I think we might even have
21 used the same curve that was in the El Yunque and El
22 Morro booklet.

23 MR. VAN RYNBACH: Yes.

24 MR. SCHILLING: Because they were the same.
25 It turned out to be. But for the other parts of the

1 T&S booklet, the hydrostatic tables to calculate the GM
2 of the ship, they're either the previously existing
3 hydrostatic tables or -- And I think they are actually.
4 So they weren't generated from HECSALV. We just used
5 the hydrostatic tables that were already in the T&S
6 booklet to reflect the current hull form.

7 MR. STETTLER: So produced by another firm.

8 MR. SCHILLING: Whatever.

9 MR. STETTLER: So that was part of what I
10 was getting at. What was the basis for the data in the
11 trim and stability book?

12 MR. SCHILLING: Right.

13 MR. STETTLER: So I think you're stating to
14 me that it was done previously.

15 MR. SCHILLING: I believe so. I'd have to
16 go back and confirm that. But I think it was what was
17 in the previous version. We could just compare the two
18 tables and see.

19 MR. STETTLER: So we don't know --

20 MR. VAN RYNBACH: That's true. This is
21 Eugene.

22 MR. STETTLER: -- what that was based on
23 then.

24 MR. SCHILLING: No.

25 MR. VAN RYNBACH: It was based on the

1 previous manual. The changes that were made were just
2 pages that were inserted into the existing manual. It
3 was not an all new manual.

4 MR. STETTLER: Okay. Very good. Actually
5 that adds another layer to this. But then so CargoMax
6 is based on a computer model that stations and offsets
7 and tanks that are modeled. And then for the intact
8 version of CargoMax uses look-ups and the like unless
9 the damage module is being used.

10 What is the basis for that model? So the
11 model from which the CargoMax, the onboard installation
12 on the El Faro, was built? What was the basis for
13 that?

14 MR. SCHILLING: Again this is Spencer. You
15 have to check with Mike Newton to be sure.

16 MR. STETTLER: Okay.

17 MR. SCHILLING: But my understanding is that
18 in keeping with the tenets of the T&S booklet was using
19 the hydrostatic table from the T&S booklet.

20 MR. STETTLER: Okay.

21 MR. SCHILLING: It's possible that hull
22 offsets were used and the calculation was done. But
23 again it was probably if there's only a zero trim, even
24 keep, hydrostatic table in the T&S booklet that was
25 used in CargoMax. Right. And so the values just like

1 in the T&S booklet were interpellated directly off of
2 that table rather than integrated directly on the hull
3 offsets of the given trim (Inaudible)

4 MR. STETTLER: Okay. Very good for now.
5 Thank you.

6 MR. GRUBER: Tom Gruber. Just to go back on
7 the calculations for the required GM curves based on
8 the wind heel. Did you run separate calculations and
9 submit them for review? Or did you just use the curves
10 from the sister vessels and submit them in the T&S
11 booklet that way?

12 MR. SCHILLING: This is Spencer. We checked
13 the curves in-house with our calculations spreadsheets
14 again, verified that the existing curves from the
15 sister ships were matched. And then we just submitted
16 them in the T&S booklet because they were essentially
17 the same curves in the approved T&S booklet from the
18 sister ships.

19 MR. GRUBER: Okay.

20 MR. SCHILLING: We did not submit a separate
21 document that gave the background for the curves.

22 MR. VAN RYNBACH: I think we did -- This is
23 Eugene again -- in the CargoMax justification. There
24 are whole tables where all the different curves are
25 derived.

1 MR. GRUBER: But the question is though when
2 the T&S booklet --

3 MR. VAN RYNBACH: The T&S booklet, no.

4 MR. GRUBER: So there is not a separate
5 stamped document of approved calculations for the El
6 Faro. Or it's actually based --

7 MR. SCHILLING: For the intact stability.

8 MR. GRUBER: For the intact.

9 MR. SCHILLING: I don't believe so, no.

10 MR. GRUBER: Okay.

11 MR. VAN RYNBACH: But we did confirm though
12 internally. We made the same calculation independently
13 and we came up with a one percent ourselves.

14 MR. STETTLER: Using HECSALV?

15 MR. SCHILLING: No, the spreadsheet. That
16 was our spreadsheet calc.

17 MR. STETTLER: Using the hydrostatic tables.

18 MR. SCHILLING: It doesn't even use
19 hydrostatic tables. The intact.

20 MR. STETTLER: Oh, just using -- Just to get
21 the GM. Got it.

22 PARTICIPANT: Uses hydro displacement.

23 MR. SCHILLING: Displacement, yes. Sorry.

24 MR. GRUBER: Did you have anything on this?

25 Any more?

1 MR. STETTLER: I think I'm done on software.
2 I think my last bit will be structural related
3 questions.

4 MR. GRUBER: Tom Gruber. On the inclining
5 experiment, did you calculate the transverse center of
6 gravity of the ship?

7 MR. VAN RYNBACH: This is Eugene. I don't
8 recall. We'd have to look at the results.

9 MR. GRUBER: Would you normally in a
10 standard review of a general cargo ship calculate the
11 transverse center of gravity? Or would it just be
12 limited to weight, vertical center and longitudinal
13 center?

14 MR. SCHILLING: It would normally be
15 calculated through the inclining process. If the
16 existing T&S booklet and things don't have any way to
17 use that it may not be carried forward in the T&S
18 booklet. Previously if they had not TCG calculations
19 and it wasn't carried forward, it's possible it wasn't
20 carried forward into the T&S booklet with the most
21 recent incline. So whether it was calculated or not
22 should be clear enough in the incline report.

23 MR. GRUBER: Again, Tom Gruber. Going
24 further into the CargoMax program, if it was
25 calculated, would it be included in the CargoMax? Is

1 it normal to include it in the Cargo Max program?

2 MR. SCHILLING: I mean it's possible.

3 Again, the baseline would be to try and match what the
4 T&S booklet had. If the T&S booklet had TCG, the
5 CargoMax should definitely have TCG.

6 If the T&S booklet doesn't have TCG, it's
7 possible that the CargoMax might include TCG as an
8 additional piece of information. But I'd have to go
9 back and see. I mean because it's -- These days it's
10 typical to have TCG because more and more ships have
11 TCGs. But certainly in years past, it wasn't always
12 the case.

13 Again, on an old ship with a conversion
14 whether it was added into CargoMax when it wasn't in
15 the T&S booklet, I can't say that's typical.

16 MR. GRUBER: Again Tom Gruber. If it was
17 not -- If the vessel had a TCG and it wasn't included
18 in CargoMax, what effect would that have on the loading
19 conditions compared to the observed ship condition once
20 she was loaded? If you could just explain it. Do you
21 understand the question?

22 MR. SCHILLING: Yeah. It will impact the
23 static heel line.

24 MR. GRUBER: How? What would -- Can you be
25 a little more specific?

1 MR. SCHILLING: Okay. The transverse center
2 of gravity, the TCG, is used to calculate a heeling
3 moment, a static condition. And so that would be
4 reflected in the difference in port and starboard
5 drafts (Inaudible) heeling and that they might
6 observe.

7 MR. GRUBER: Thank you.

8 MR. VAN RYNBACH: Hold on. This is Eugene.
9 If you go -- If you look at the inclining experiment
10 report.

11 MR. STOLZENBERG: And this is from 2006.

12 MR. VAN RYNBACH: Yes. The TCG is
13 calculated for the light ship based on the
14 measurements. We're looking at the condition one which
15 is light ship.

16 MR. GRUBER: What page?

17 MR. VAN RYNBACH: On page 17 of the PDF
18 file.

19 PARTICIPANT: Actually I apologize.
20 Actually that's my note on there.

21 MR. GRUBER: Okay.

22 PARTICIPANT: And actually this is one of
23 those things. There is actually a tank that's in the
24 wrong place. So that affects this. So it's close to
25 zero.

1 MR. VAN RYNBACH: Also what CargoMax does --
2 if you look at an output from CargoMax, if we have a
3 sample output -- that would tell you whether or not
4 transverse center of gravity is calculated. So we
5 could check that immediately.

6 MR. SCHILLING: Right.

7 MR. FRANCE: In CargoMax.

8 MR. VAN RYNBACH: Yes, if we have a sample
9 output.

10 MR. FRANCE: Yes, I can provide that. I
11 assume we can do this, sir.

12 MR. STOLZENBERG: Yes.

13 MR. GRUBER: These conditions in the T&S
14 booklet are CargoMax output.

15 MR. VAN RYNBACH: No, that's the T&S
16 booklet.

17 PARTICIPANT: So this is actually at
18 departure.

19 MR. STOLZENBERG: Slow down a minute. If
20 we're going to look at a document, we've got to take
21 the time to say the document we're going to look at and
22 just as housekeeping rules and give the file name and
23 the document we're talking a look at and the page.

24 So we're talking a look at the CargoMax
25 printout 10 of 115 rev one PDF and we're on voyage 185

1 and it's printed on October 1 at 11:48 a.m. And it's
2 for the El Faro. And we are looking at the departure
3 trim stability summary Jacksonville final.

4 MR. VAN RYNBACH: This is Eugene. And it
5 does show that the transverse center of gravity is
6 calculated for the various weight components to come up
7 with a total for the ship. And then possibly could you
8 scroll down a little bit?

9 MR. STOLZENBERG: Sure.

10 MR. VAN RYNBACH: There is also a predicted
11 angle of heel probably. Yes. If you look at the
12 stability output, the trim calculation on the right
13 side of the page indicates a predicted list of 2.29
14 degrees to starboard. So that's typically a standard
15 feature in CargoMax to try and calculate the ship's
16 static heel.

17 MR. GRUBER: But if the TCG is omitted, if
18 there is a TCG to one side or the other, then this list
19 is going to be incorrect.

20 MR. VAN RYNBACH: A TCG of what?

21 MR. STOLZENBERG: The light ship.

22 MR. GRUBER: The light ship TCG.

23 MR. VAN RYNBACH: Yes.

24 MR. SCHILLING: This is Spencer. Again
25 using the source as the T&S booklet which didn't list

1 the TCG because it hadn't been in that book ever before
2 and I don't think the hand forms do TCG calcs, when
3 they put CargoMax together they didn't have information
4 on the TCG for the light ship assuming it was zero.
5 That's my speculation.

6 MR. VAN RYNBACH: But we know that it's very
7 close to zero.

8 MR. SCHILLING: Yes.

9 MR. VAN RYNBACH: From the incline.

10 MR. O'MEARA: This is Dennis. Just so I
11 understand it better, we previously had heard in other
12 interviews that the vessel load limits that they used
13 at the dock were 100 times of available dead weight, a
14 half of foot of GM margin and zero degrees of list.
15 Those were the desired conditions.

16 And it sounded -- at least I came across as
17 -- that that was what they used all the time. Would
18 there be any forcing function to improve on those
19 limits if you anticipated weather conditions that were
20 going to be particularly severe? Is there anything
21 that would say 100 tons of available dead weight is too
22 small? Or a half of foot of GM margin is too low?

23 Would there be a rationale to say under
24 certain conditions we might not want to use those as
25 the limit? We might want to make it more stringent.

1 MR. SCHILLING: This is Spencer. Certainly
2 owners are free to apply any additional margins or set
3 those sorts of criteria which are above and beyond what
4 the regulations require. So when you say a half of
5 foot of GM margin, that's margin above the required
6 value which might be three, four or five feet. And
7 likewise the dead weight margin just to give you a
8 little bit and make sure you're not exceedingly your
9 load line and give you some margin in that.

10 And some of that is done so that if there
11 are any slight differences in the calculated value
12 versus the observed draft value or some hull deflection
13 and things like that, you can make sure that your marks
14 aren't under and those kinds of things.

15 But there is no guidance in the rules or any
16 that are typically applied based on the rules and what
17 the rules are based on that are given to operators to
18 say in a certain weather conditions you have to exceed
19 what the rules require.

20 There is no standard guidance like that.
21 There's none ever given really from the direction of
22 the booklet's requirement. The requirement is what it
23 is. And if you meet that, you satisfy everything. To
24 the safety level, that was determined adequate when the
25 rules were put together.

1 MR. O'MEARA: Okay. Thank you.

2 MR. VAN RYNBACH: Excuse me. Can I go to
3 the men's room?

4 MR. STOLZENBERG: Let's go off the record
5 for a moment.

6 (Whereupon, a short recess was taken)

7 MR. STOLZENBERG: This is Eric Stolzenberg.
8 The time now is 1515. We're back on the record at
9 Herbert Engineering in Annapolis.

10 Jeff.

11 MR. STETTLER: Okay. I'd like to actually
12 change gears and talk a little bit about structures.
13 I've basically got two lines of questioning or two
14 questions related.

15 Spencer, based on an earlier email from you
16 the other day you stated or you told me or the Coast
17 Guard that or understand that HEC did not perform any
18 structural analysis of scantlings including the hull
19 (Inaudible) section modules and buckling assessments
20 other than the deck modifications you did in 2005 to
21 strengthen the deck. You had stated that you had done
22 analysis of the deck including (Inaudible) analysis.

23 But you did not do any either global or hull
24 girder or section modules calculations or buckling
25 analysis. You used the allowable bending moments that

1 were provided based on previous documentation.

2 Under what circumstances would Herbert
3 Engineering doing this type of work would have done
4 your own hull girder section module and buckling
5 assessment of a ship like this?

6 MR. SCHILLING: Yes, this is Spencer. Again
7 with this modification we were making, we weren't
8 impacting any of the hull girder strength. The
9 analysis we did for the main deck was simply to look at
10 the local loads from the container stacks. What we
11 reinforced was not anything that impacted section
12 modules, but rather local beam flanges we put riders on
13 (inaudible) on those or reinforced a pillar that was
14 taking a vertical load down into the ship's structure.
15 So all of the analysis was related to the container
16 loads transferred into the hull structure and not
17 related to bending moment.

18 The distribution of containers on deck
19 certainly impacts bending moment. It impacts the loads
20 on the hull girder bending loads in the hull. But
21 that's accounted for in the loading manual, the
22 assessment of bending moments, through the normal
23 process and in CargoMax. And you use the assigned
24 allowable bending moments which are based on the hull
25 structure to set the limit on how the container load

1 can be loaded.

2 Again, we weren't touching anything that
3 impacted hull girder section modules. And so there was
4 no need to reassess the allowable bending moments that
5 were assigned by Class.

6 MR. STETTLER: Were you aware of any such
7 analysis being done? Did you see any references as you
8 were going through and preparing your work that a hull
9 girder section module and a hand buckling analysis had
10 been done on the hull previously?

11 MR. SCHILLING: None for the El Faro. I
12 couldn't find -- and I don't recall -- any calculations
13 of the hull girder section modules and the distribution
14 of the allowable weight bending moment. We have some
15 documentation that says what the allowable bending
16 moment is midship. And when the ships were built, all
17 they did was apply a midship value.

18 But I couldn't find whether we did any
19 calculations that calculated section modules at various
20 locations and calculated the distribution of the
21 allowable bending moment. I just don't recall it and
22 can't find anything in our files

23 On the Great Land, we did some scanning
24 recesses and I think I've provided those reports. And
25 in there we take a look at some of the buckling

1 strength of the bottom structure and inner bottom
2 structure as designed for the allowable bending moment
3 I think just to check and see how it was doing. At
4 that point, they were looking at how much we had done
5 in structure in the inner bottom.

6 The double bottom is transversely framed as
7 is the side shell. And they've got a floor at every
8 frame. So there's a lot of redundant structure for
9 local and secondary loads in cargo hulls and tanks.
10 But because it's transversely framed, it's a little
11 more susceptible to buckling. So we checked to make
12 sure in at least that basic buckling criteria at that
13 point we satisfy ourselves that it did. But there was
14 no need for us to reassess the (Inaudible)

15 MR. STETTLER: This is Jeff Stettler again.
16 Was that the Great Land? That analysis you did on the
17 Great Land was that before or after. I know Herbert
18 Engineering had done an analysis on the Lauraline which
19 I think is a pseudo sister vessel that had some
20 different arrangements. Are you familiar with the
21 analysis Herbert Engineering did on the Lauraline?

22 MR. SCHILLING: This is Spencer. I
23 recollect that we worked on that. I don't remember
24 when the analysis was done. Now the Lauraline was
25 completely converted and gutted. A full container

1 ship. So it no longer has any row-row capacity in the
2 cargo holds. It has some row-row capacity in the
3 stern. But the entire inside of the hull was gutted
4 and turned into a container ship.

5 MR. STETTLER: I'm actually going to not --
6 Mike Venturella had sent a question along those lines.
7 I just want to make sure that there wasn't something
8 else in there. I'm going to pass to Tom if you have a
9 follow-up question.

10 MR. GRUBER: Tom Gruber. The Lauraline also
11 had a different length which would have affected the
12 calculations, correct?

13 MR. SCHILLING: Okay.

14 MR. GRUBER: I think the mid body that was
15 added was a different length. Would that have affected
16 the calculations and their transference to the El Faro
17 and those similar hulls?

18 MR. SCHILLING: This is Spencer. It could.
19 It depends what calculations we're talking about. In
20 terms of the buckling capacity, maybe not because
21 that's based on local plate thickness and stiffener
22 space and things like that. If it's in terms of the
23 actual bending moments that were generated in those
24 bottom plates and things, yes. That could certainly
25 affect that.

1 But I don't have a recollection of the
2 actual length. And it was completely converted and
3 taken out of this row-row service.

4 MR. GRUBER: Thank you.

5 MR. STETTLER: I just looked at Mike
6 Venturella's question and I think we've answered this
7 already. So thank you.

8 MR. STOLZENBERG: This is Eric Stolzenberg.
9 Just to go back a little along the same lines, what
10 structural criterion was in effect or what was required
11 by Class and the Coast Guard for the El Faro?

12 MR. SCHILLING: Well, the structural
13 criteria is ABS Class rules.

14 MR. STOLZENBERG: Okay.

15 MR. SCHILLING: So those are in effect and
16 it was of course designed to an old set of rules back
17 in the '60s or '70s. That wouldn't be the applicable
18 rule at this point. They didn't -- As a rule changes,
19 they grandfathered ships in. And they're not required
20 to the new rules automatically.

21 MR. STOLZENBERG: So even in 1993 when it
22 went through a new inclining and had new intact and
23 damage stability analysis it wouldn't have to meet a
24 different structural year requirement from the ABS
25 Class.

1 MR. SCHILLING: It was a major conversion
2 and certainly when they're looking at longitudinal
3 strength and things like that or updating bending
4 moments, whether those requirements are reassessed what
5 the ship's capacity was. Well, it was a need to make
6 sure that the strength capacity was appropriate for the
7 length.

8 Part of the conversion for mid body is
9 adding strapping and everything else to handle the
10 higher loads. So it's not just in the mid body, but
11 beyond the mid body and the deck and in the bottom to
12 increase the section modules to get the strength that
13 you need for the longer ship. And that's all done. So
14 that's brought up to the requirements of the bending
15 moments at the time.

16 MR. STOLZENBERG: And so when Herbert comes
17 in in the mid 2000s you're looking at documents
18 generated back from the '70s or documents from the '93
19 conversion regarding structure, the whole group of
20 section modules.

21 MR. SCHILLING: I think that the bending
22 moment we used was on the scanning plan of the midship
23 section from '93.

24 MR. STOLZENBERG: Okay.

25 MR. SCHILLING: I think there's an allowable

1 bending moment listed there. And it was the same as
2 the El Yunque and El Morro. I'm pretty sure.

3 MR. STOLZENBERG: And that can be found in
4 the documentation, right? It would be a reference or.

5 MR. SCHILLING: Yes, it's on the scattling
6 (phonetic) plan for the conversion.

7 MR. STOLZENBERG: Okay. That's all I have
8 on that line. Mike, any questions regarding these
9 topics?

10 MR. KUCHARSKI: No.

11 MR. STOLZENBERG: Okay. I'll go to Jeff
12 again.

13 MR. STETTLER: Actually that was it for
14 structures. Does anybody else want to discuss anything
15 with structures?

16 MR. GRUBER: No.

17 MR. STETTLER: I've got two other relatively
18 minor. Did the general arrangement drawing list a fire
19 control and safety plan as a reference? And from the
20 number it looked like that was something that Herbert
21 Engineering produced. Is that something you have
22 available today and could we request a copy of that,
23 maybe an electronic copy?

24 MR. VAN RYNBACH: We have a copy printed and
25 electronic if you would like.

1 MR. STETTLER: Okay. Yes, that was not
2 specifically on our request list. And I noticed
3 looking at the drawing that it was listed in the
4 reference. And that's something that's missing from
5 our files. So if I could request that from you, that
6 would be helpful.

7 MR. SCHILLING: As a typical process, we
8 just copied TOTE on anything we sent because officially
9 they own all of this material.

10 MR. STETTLER: Right. I believe that was
11 requested from TOTE and TOTE couldn't find it or wasn't
12 able to -- So I'm happy you guys had it. So that was
13 actually a Herbert Engineering drawing, correct?

14 MR. SCHILLING: I believe so, yes.

15 MR. STETTLER: Similar to (Inaudible)

16 MR. VAN RYNBACH: What format would you
17 like, electronically or?

18 MR. STETTLER: PDF would be fine. Like
19 this, that would be fine.

20 MR. VAN RYNBACH: Okay.

21 MR. STOLZENBERG: What's the name of that
22 drawing?

23 MR. O'MEARA: (Inaudible) control and safety
24 plan. Will you be sending a list to request this
25 sufficiently or should I just make it up?

1 MR. STETTLER: I can send out an additional
2 list.

3 MR. O'MEARA: Thank you.

4 MR. SCHILLING: There were a few things that
5 I wanted to talk to you about that we didn't get.

6 MR. STOLZENBERG: Okay. We'll double check
7 because for some reason that plan also rings a bell.
8 We may have it, but I'll certainly let you know.

9 MR. STETTLER: I haven't seen it in going
10 through the --

11 MR. STOLZENBERG: This is Eric Stolzenberg.
12 I'd like to go to a question about CargoMax and
13 strength. You know looking at the CargoMax output it
14 does provide a sheer force and bending moment maximum
15 limit. I believe in some of the test cases in the
16 manual it shows it as exceeding of the limits. Just
17 briefly, how does CargoMax calculate the sheer force
18 and the bending moment in the program in general?

19 MR. SCHILLING: This is Spencer. Yes, it's
20 just a fundamental calculation of the weight force and
21 weight moment -- I'm sorry. The weight force and
22 buoyant force at a given frame. If we think about a
23 midship, it adds up all the buoyancy aft the midship
24 and all the weight aft of midship and the difference
25 gives you a sheer force.

1 And for the bending moment, it calculates
2 the moment of that weight aft the midship. So that
3 weight has an LCG and it gives you a weight moment.
4 And the buoyant moment, same thing. It's got an LCB
5 and you've got a buoyant volume weight displacement and
6 that gives you a buoyant moment. The difference is the
7 bending moment.

8 MR. STOLZENBERG: Okay. Another question I
9 have along the same lines is what's the practical
10 implication of exceeding those limits to your
11 knowledge. In other words, if it's exceeded by 10
12 percent what happens? And I realize this is an opinion
13 question again. What kind of margin of safety is built
14 into those?

15 (Simultaneous speaking)

16 Clearly it's an opinion question.

17 MR. SCHILLING: This is Spencer. I think
18 it's important to understand that these are the
19 allowables that are in the manual which are the still
20 water allowables. So those calculations for buoyancy
21 are done at a still water line, the current draft and
22 trim. So it's called the allowable still water moment.

23 And to that, you have to add a wave bending
24 moment to get the total moment that's applied to the
25 hull girder. And it's that total moment that you have

1 to compare to the actual structural capacity of the
2 hull.

3 And typically the wave bending moment by
4 rule is in a range of or can be equal to the still
5 water allowable moment. So the total structural
6 capacity of the hull can be twice that the still water
7 allowable is shown.

8 And in fact there is a still water allowable
9 for at sea. So when you go to sea it gets that full
10 margin on it for the potential wave moment.

11 There's also an in harbor allowable
12 sometimes. And I'm not sure if the El Faro has an in
13 harbor allowable. That just takes away that wave
14 component. And you can also load a ship up to
15 allowable bending and in harbor as you do at sea.

16 But in both cases it's well below the
17 structure capacity of the ship. And it's the addition
18 of a wave moment that has the potential to push it to
19 something over the structure capacity of the ship.

20 MR. STOLZENBERG: Okay. You answered my
21 next question. How are the margins of safety
22 considered for that?

23 MR. SCHILLING: The structural capacity of
24 the ship in the rules is that a certain allowable
25 stress that also includes safety margins in it.

1 Certain capacity, they use the strength of the material
2 or in other cases, the buckling capacity shift the
3 margins on that, too. So that weight, that total
4 capacity, is not figured as the absolute expected
5 failure point. There is some margin in that, too.

6 MR. STOLZENBERG: And I assume there's room
7 for wastage of steel to a certain degree as well in
8 addition.

9 MR. SCHILLING: Right. In the rules. The
10 rules under which this was built and served, all the
11 calculations for section modules and structure capacity
12 are based on the as-built or gross scantlings. And
13 those include margin for corrosion. It's not explicit.
14 But there's some margin for corrosion.

15 That corrosion margin is controlled by the
16 wastage allowances specified in the rules to be checked
17 in service. So when they go do a survey and they do
18 gaugings of your steel plate and things like that, they
19 know they can go to 20-25-30 percent of the as-built
20 thickness and the structural capacity is assumed to
21 still be adequate based on rules it was built to.

22 MR. STOLZENBERG: When you say rules, you
23 mean Class rules?

24 MR. SCHILLING: Yes.

25 MR. FRANCE: I think you said 25 percent of

1 the as-built. Twenty-five percent wastage from the as-
2 built.

3 MR. SCHILLING: That's correct.

4 MR. FRANCE: Not 25 percent of the as-built.

5 MR. SCHILLING: Correct.

6 MR. FRANCE: And also I think ABS in their
7 analysis of gaugings normally allows 10 percent
8 reduction in the overall section module strengthened in
9 a frame due to wastage.

10 MR. SCHILLING: So the local wastage issue
11 may be 25-30 percent. It's again the diminution amount
12 of 25-30 percent and there's a global hull girder
13 corrosion allowance built into 10 percent reduction
14 section modules. You can't go below that in any case.

15 MR. STOLZENBERG: All ask anyone. Mike on
16 the phone, any questions along those lines?

17 MR. KUCHARSKI: Negative.

18 MR. STOLZENBERG: Why don't we just follow
19 up along same type of thinking. We're talking about
20 Class again.

21 From your perspective, is there any change
22 in stability and structural requirements when a vessel
23 moves from Coast Guard regulated to the alternate
24 compliance program where ABS takes more of the load?
25 And what kind of changes do you see at a naval

1 architecture firm level? Or is it the same? I'm just
2 looking for some ideas on how it works. What kind of
3 changes is it for a naval architecture firm for a
4 vessel that moves from Coast Guard regulated to
5 alternate compliance program with Class?

6 MR. SCHILLING: This is Spencer. I mean
7 there are no changes in the requirements, stability
8 requirements, strength requirements. Well, there's a
9 supplement for some differences. But for the most part
10 it's just like changing process. We just submit the
11 drawings to the different organizations to do the
12 approvals.

13 MR. STOLZENBERG: Just excuse my ignorance.
14 So for a Coast Guard traditionally regulated vessel,
15 you would go to the Marine Safety Center of the Coast
16 Guard or the OCMI. And now the majority of these
17 documents go to ABS.

18 MR. SCHILLING: Right. For basic stability
19 and strength issues, it's a procedural change. There's
20 a supplement for ABS and for the Class societies doing
21 an ACP program that covers differences in the rules.
22 And it's mostly equipment system and some material
23 related issues and not fundamental stability and
24 strength related issues.

25 MR. STOLZENBERG: Okay. Thank you. Any

1 other questions along those lines?

2 MR. GRUBER: No.

3 MR. STOLZENBERG: I guess I'll follow up
4 again. The same line of thinking in general just
5 because we have naval archs here. Do you work with
6 other Class societies other than ABS?

7 MR. SCHILLING: Yes, we do design work that
8 is approved by other Class societies.

9 MR. STOLZENBERG: Is there a difference, a
10 fundamental difference, between DNB, Lloyds, Reno
11 (phonetic) or other class societies regarding stability
12 and structures than ABS in your opinion and experience?

13 MR. SCHILLING: This is Spencer. So you
14 have to look at them differently. Stability
15 traditionally is not a class function. Stability is
16 primarily a flag state IMO function. So the Class size
17 are basically checking against those requirements.
18 There may be some cases where the Class has guidelines
19 and things that suggest. But stability is primarily
20 not a Class function.

21 All the structure and systems and equipment
22 are more in the realm of Class. And the major Class
23 societies agree pretty much on all the primary
24 structural issues. I mean there's IX and they
25 coordinate all the harmonization and all the structural

1 rules and things like that.

2 Even a number of years ago they brought
3 together their calculations for rule on bending moment
4 for instance and things like that. They brought them
5 close. And the basic way they approach hull girder
6 strength and (Inaudible) water moments and things like
7 that are similar. They're not precisely the same in
8 all cases, but they're similar. Certainly for tankers
9 and bulk carriers, they're identical now because they
10 have the harmonized CSR rules.

11 MR. VAN RYNBACH: Common structure.

12 MR. SCHILLING: Common structure rules. So
13 we don't see big differences in that. Again, way back
14 there used to be differences in local scantling
15 requirements and other things that dealt with side
16 shell framing and the details of the GMLs and things
17 like that. Buckling analyses were different. But
18 they're coming more and more in a similar mode.

19 MR. STOLZENBERG: Okay. Thank you. That's
20 what I was looking for to get an idea of where we've
21 been and where we're going and what differences there
22 might be. Again, I'll kick that line around the table
23 and to Mike on the phone.

24 (No verbal response)

25 MR. KUCHARSKI: Nothing on the phone.

1 MR. STOLZENBERG: All right. Then I'd ask.
2 It seems like we're wrapping up, but I'll go around.
3 Dennis, any issues you have?

4 MR. O'MEARA: None.

5 MR. GRUBER: None

6 MR. STETTLER: The only thing is there was a
7 line of questioning that I think relates more
8 specifically to some of the details of CargoMax that
9 I'd like to address. I think based on our discussion
10 this morning that we include we probably need to maybe
11 get Mike Newton on the phone or something.

12 And I would like to propose to Mr.
13 Stolzenberg maybe we set up a separate time for that.
14 I think we could probably do a phone interview. A lot
15 of it is housekeeping and just to clarify a few issues
16 specifically with CargoMax. Does that sound reasonable
17 to everybody rather than trying to address it here
18 today?

19 MR. SCHILLING: This is Spencer. I would
20 think so. I mean because in terms of actual
21 implementation of the CargoMax and what went on in that
22 process and when it was updated and things like that he
23 would have a much better handle of it. I don't know if
24 he was in charge of doing it for the ship. But he
25 would be in a position to find out.

1 MR. STETTLER: Okay. Just based on what you
2 said today, I think he'll probably be able to answer
3 most of it.

4 MR. SCHILLING: I haven't been directly
5 involved with software since 1999

6 MR. STETTLER: Right.

7 MR. STOLZENBERG: Okay. That sounds good.
8 We can do that. Anything else, Jeff?

9 MR. STETTLER: No.

10 MR. KUCHARSKI: Mike on the phone, any
11 issues or things we haven't covered that you'd like to
12 address and cover now please feel free.

13 MR. KUCHARSKI: No, that's it. Thank you.
14 I support the follow-up from CargoMax as separate for
15 that.

16 MR. STOLZENBERG: I have one more and then
17 you'll get the last word like you mentioned at lunch.

18 MR. FRANCE: That's always what I want.

19 MR. STOLZENBERG: One thing I'd like to ask.
20 Is there anything that we didn't ask that was important
21 to ask regarding strength stability today that we don't
22 know that would be good for us to know or things that
23 are on your mind that we should know? I throw that out
24 there for you to take the floor.

25 MR. SCHILLING: This is Spencer. I don't

1 think there's any questions that you didn't ask. It
2 was interesting. I understand on the procedural issues
3 and documentation of how important that is.

4 But in my mind coming from the stability and
5 strength not much of it was related to what actually
6 caused the casualty on the date of the event. And our
7 biggest curiosity is what was the intact loading
8 condition when it left and how does that relate to
9 things. We haven't seen any of that. So we have no
10 way to analyze what was going on because we haven't
11 seen that information. So that's the remaining big
12 curiosity on our part is to be able to take a look at
13 that and seeing what the situation was.

14 I don't have any other. I don't think there
15 are any other questions to pursue with us.

16 MR. STOLZENBERG: How about do you have
17 anybody or know of anyone else we should interview? I
18 know we brought up Mike Newton. Is there another
19 individual you've run into in the past who might have
20 some knowledge of the vessel or technical information
21 that we should at least speak to them about? And not
22 necessarily from Herbert either. Just in general.

23 MR. SCHILLING: I've tried to go back
24 through the records and find out what we did for the El
25 Faro and see what was going on and talk to people in

1 the office about what was happening. I don't know -- I
2 think I've actually got the bigger and best picture
3 overall. I don't think you need to see anybody else.
4 I don't know if I can recommend somebody else.

5 MR. STOLZENBERG: Okay. That's fine. I
6 just like to check because we don't know what you know
7 always. And if you had a pertinent individual that had
8 done work at a certain time and now works for another
9 organization if that can be helpful.

10 So very well. I'll go around one last
11 chance and then Willa and we'll wrap it.

12 MR. FRANCE: Having now appeared in the NTSB
13 proceeding on behalf of Herbert, this was a question
14 that came up in the Coast Guard telephone conversation
15 the other day. So far as further communications are
16 concerned, I'm quite happy that you guys communicate
17 the way you have been with Spencer because you have
18 seemed to build up a rapport. You know what each is
19 thinking about and so on. That's fine with me. Just
20 copy me as the attorney. Okay. Is that an
21 appropriate request to make?

22 MR. STOLZENBERG: I think under our rules we
23 can.

24 MR. FRANCE: Okay. Fair enough.

25 MR. STOLZENBERG: I will double check with

1 my GC. I don't think it's an atypical request. But
2 I'm going to double check before I commit.

3 MR. FRANCE: All right. That would be the
4 only thing I would have.

5 MR. STOLZENBERG: Thank you. Noted and I
6 will follow up on it. Okay. We're going off the
7 record. The time is now 1541. Off the record.

8 (Whereupon, at 3:41 p.m., the above-entitled
9 matter was concluded.)

MATTER: El Faro Incident
October 1, 2015
Accident No. DCA16MM001
Interview of Eugene Van Rybach/
Spencer Shilling

DATE: 01-28-16

I hereby certify that the attached transcription of page 1 to 169 inclusive are to the best of my professional ability a true, accurate, and complete record of the above referenced proceedings as contained on the provided audio recording; further that I am neither counsel for, nor related to, nor employed by any of the parties to this action in which this proceeding has taken place; and further that I am not financially nor otherwise interested in the outcome of the action.

TELEFAX

DATE: 29 December 2005 PAGE: 1 of 1
TO: Herbert Engineering FILE REF: S-1
ATTN: Mr. Eugene Van Rynbach REFER TO: PB
FAX NO: By e-mail PID:
FROM: Thomas M. Gruber CC: ABS Mobile - C. Barry
SUBJECT: "NORTHERN LIGHTS" ID 7500285
Sun S/B Hull 670
1966 Load Lines - Preliminary Freeboard Assignment

The requested 1966 type "B" preliminary freeboard assignment (based on sister vessel, EL MORRO, hull 666) is as follows:

Center of Ring below upper edge of Deck Line	: 12'-0-15/16"
Deck line located opposite top of steel 2nd deck at side	
Tropical-Fresh above Center of Ring	: 1'-3"
Fresh above Center of Ring	: 7-1/2"
Tropical above Center of Ring	: 7-1/2"
Summer through Center of Ring	: -----
Winter below Center of Ring	: 7-1/2"
Winter North Atlantic below Center of Ring	: N/A

Midship point located 12-1/2" FWD of Fr. 134/8	Load Line Length: 736.75'
Corresponding Molded Draft: 30'-1-5/16"	Extreme Draft: 30'-2-3/8"

These marks are forwarded at the shipyard request in order to mark the vessel's sides while in the shipyard. The marks actually assigned to the vessel will be based upon the final stability approval letter issued by this office and may differ from those indicated above. If the owner wishes to put the above marks on the vessel, they may do so at their risk. ABS assumes no responsibility should the load line marks change. The official assignment will be made after our final review of the vessel's stability.

If you have any questions, please feel free to contact this office at any time.

Best regards,

Thomas M. Gruber
Principal Engineer,
Ship Engineering Department

NOTES:

The above GMT values are based on a formula from the U.S. Coast Guard Regulations Section 46 CFR 170.170, Weather Criterion for Stability of Inspected Vessels. They are intended to limit the ship's static heel to the lesser of 14 degrees or one-half the freeboard if exposed to a beam wind of approximately 60 m.p.h.

These GMT are net amounts after the deduction for free surface.

These requirements exceed dynamic stability and damage stability requirements.
